LIBRARY REGULATIONS

(a) Books, periodicals and pamphlets may be borrowed by Fellows, Ordinary Members, Associates and Affiliates personally or by a messenger producing a written order. The person to whom such publications are delivered shall sign a receipt for them in a book provided for that purpose.

(b) Publications may be borrowed through the post, or by other means of carriage, upon a written order. The postage or carriage of publications returned to the Society shall be defrayed by the borrower.

(c) A borrower may not have more than three publications in his possession at one time.

(d) A borrower will be considered liable for the value of any publication lost or damaged while on loan to him, and, if it be a single volume or part of a set, for the value of the whole work thereby rendered imperfect. Marking or writing in the publications is not permitted, and borrowers are requested to call attention to damage of this character.

(e) Books and pamphlets may be retained for twenty-eight days. Periodicals may be retained for fourteen days. Applications for extension of the loan period must be made in writing before its expiry. No publication may be kept longer than three months.

(f) Books and pamphlets added to the library will not be lent until after the expiry of one month from the date received. The current number of a periodical may not be borrowed.

(g) Borrowers retaining publications longer than the time specified, and neglecting to return them when demanded, forfeit the right to borrow until they be returned, and for such further time as may be ordered by the Council.

Any borrower failing to comply with a request for the return of a publication shall be considered liable for the cost of replacing it, and the Council may, after giving due notice to him, order it to be replaced at his expense.

No publication may be reissued to the same borrower until at least seven days have elapsed after its return, neither may it be transferred by one borrower to another.

(h) Publications may not be taken or sent out of the United Kingdom.

(i) Publications returned through the post must be securely packed in a box or otherwise adequately protected.

(j) The Library may be used for reference by Fellows, Ordinary Members, Associates and Affiliates during the office hours of the Society.

(k) Parcels should be addressed:

TABLES

Table	Subject of Table	Page
	Section A: Married Women Aged Under 50 at Census; Married Once Only or More Than Once	
A.1	All Married Women by Census Age and Marriage Duration	2
A.2	All Married Women by Census Age and Size of Family	2
A.3	All Married Women by Census Age, Marriage Duration and Size of Family	4
A.4	Women Married Once Only by Census Age, Marriage Duration and Size of Family	16

TABLES - *continued*

Table	Subject of Table	Page
	Section A: Married Women Aged Under 50 at Census; Married Once Only or More Than Once - <i>continued</i>	
A.5	All Married Women by Census Age, Marriage Duration, Size of Family and Current Fertility	28
A.6	Women Married Once Only by Census Age, Marriage Duration, Size of Family and Current Fertility	30
A.7	Women Married More Than Once by Census Age, Time since First Marriage, Size of Family and Current Fertility	34
A.8	All Married Women by Marriage Age and Duration, Size of Family and Current Fertility	38
A.9	Women Married Once Only by Marriage Age and Duration, Size of Family and Current Fertility	40
A.10	Women Married More Than Once by Age at, and Duration of, Current Marriage, Size of Family and Current Fertility	44
A.11	Women Married More Than Once by Age at, and Time since, First Marriage, Size of Family and Current Fertility	46
A.12	Women Married Once Only and Enumerated With Their Husbands, by Marriage Age and Duration, Size of Family and Current Fertility	50
A.13	Ratios of the Fertility of Women Married Once Only to that of All Women	54
A.14	Ratios of the Fertility of Women Married Once Only and Enumerated With Their Husbands to that of All Women Married Once Only	54
A.15	Women Married More Than Once by Age at, and Duration of, Current Marriage, showing Mean Family Size, Current Fertility and Infertility, and Ratios of their Fertility to that of All Married Women (unadjusted)	55
A.16	Women Married More Than Once by Age at, and Time since, First Marriage, showing Mean Family Size, Current Fertility and Infertility, and Ratios of their Fertility to that of All Married Women (unadjusted)	56
	Section B: Married Women Aged Under 50 at Census; Married Once Only and Enumerated With Their Husbands (Tables B.1-5) or Gainfully Occupied (Table B.6): Geographical and Social Sections	
B.1	Regions of England and Wales, Conurbations and Urban/Rural Aggregates	58
B.2	Social Classes	86
B.3	Socio-Economic Groups	91
B.4	Urban/Rural Aggregates by Socio-Economic Groups	104
B.5	Differences between Ages of Husband and Wife	169
B.6	Occupied Married Women (whether or not enumerated with their husbands)	176
	Section C: Married Women Aged 45-49 at Census (Completed Fertility); Married Once Only and Enumerated With Their Husbands: Geographical and Social Sections	
C.1	All Women	178
C.2	Social Classes	178
C.3	Socio-Economic Groups	180
C.4	Urban/Rural Aggregates by Socio-Economic Group	183
C.5	Husband's Terminal Education Age by Socio-Economic Group	198
C.6	Industry Groups by Socio-Economic Group	207

TABLES - continued

Table	Subject of Table	Page
	Section D: Women Married at Ages Under 45 in the years 1920 to 1954; Married Once Only: Mean Family Size by Calendar Year of, Age at and Duration of Marriage	
D.1	All Marriage Ages under 45	238
D.2	Marriage Age under 20	238
D.3	Marriage Age 20-24	240
D.4	Marriage Age 25-29	240
D.5	Marriage Age 30-34	242

E.5	Marriage Age 30-34	250
E.6	Marriage Age 35-39	250
E.7	Marriage Age 40-44	251

Programme of Census Reports and other census information

The *Census 1951, England and Wales, Preliminary Report*, published in July, 1951, contains a general note on the taking of the census, some brief preliminary statistical commentary, and provisional populations for all local authority areas (counties, boroughs, urban and rural districts).

The *Census 1951, Great Britain, One per cent Sample Tables*, published in two parts in July and November, 1952, present an advance picture of the pattern of the main results. The tables relate to Great Britain and, with correspondingly less detail, to various smaller areas according to the size of their populations. The subjects covered are Ages and Marital Condition; Occupations; Industries; Housing, Characteristics and Composition of Private Households; Non-Private Households; Education; Birthplace and Nationality; Fertility; Welsh and Gaelic Languages; together with a Conurbation Supplement.

The 1951 series of *County Reports*, already published, comprises most of the statistics of predominantly local interest, namely, populations and acreages of local government, parliamentary and petty sessional areas; private households, the rooms and dwellings in which they live and the household arrangements possessed by them, together with the complementary record of institutions, etc., housing various categories of non-private population; birthplace and nationality; education; social class; distribution of the local populations according to sex, age and marital condition.

The *Report on Welsh Speaking Population* gives the statistics on the speaking of the Welsh language by those enumerated in Wales, including Monmouthshire, with a brief commentary on the census enquiry.

The *Populations of Ecclesiastical Areas (England)* gives populations of ecclesiastical parishes and dioceses in England.

The *Index of Place Names* gives the location and the census population of places with defined boundaries.

The *Report on Greater London and Five Other Conurbations* gives statistics for the six major conurbations in England and Wales (Greater London, South East Lancashire, West Midlands, West Yorkshire, Merseyside, Tyneside) and for certain main divisions and sub-divisions, as already identified in the Sample Tables, generally on the lines of the County Reports.

The *Report on Usual Residence and Workplace* contains tables showing the population resident in one specified area and working in another, the units of area being boroughs, urban and rural districts; tables comparing the enumerated census population in local areas, using the same units of area already mentioned, with an alternative allocation based on the statement of usual residence returned on the census schedules, together with the numbers enumerated there who were usually resident outside England and Wales, and tables classifying the latter by country of usual residence and by age.

The volume of *Occupation Tables* gives statistics of the occupied population based on their personal occupation (classified according to the unit groups of the *Census 1951, Classification of Occupations*), including statistics of local populations according to the area in which they were enumerated, and with reference to age, marital condition, industrial status in employment (manager, employer, etc.) social classes and socio-economic groups.

The volume of *Industry Tables* gives statistics of the occupied population based on the industrial activity to which their occupations contribute with identification of industrial status categories, age-groups, and

married women, the industry units being those of the Standard Industrial Classification. Statistics of local populations are based on the area (borough, urban and rural district) containing the place of work. This volume also contains an analysis of each important industry or group of industries showing the principal occupations contributing to the industry.

The volume of *General Tables* mainly comprises summaries of the information given in the County Reports on local populations (with figures for county court districts in addition), the various categories of non-private population, birthplace and nationality, ages and marital condition, and education.

The *Housing Report* summarises the housing information given in the County Reports relating to private households, with a commentary on the figures.

The present *Fertility Report* gives statistics derived from the questions put to married women under the age of 50 on the date of marriage and number of children, with a commentary.

The *General Report* contains a report on the census operation as a whole, together with a commentary on those fields of census statistics not covered elsewhere, such as the occupation and industry, education, birthplace and population tables.

Note:

With regard to census information not presented in the published reports referred to above, Section 4(2) of the Census Act, 1920, empowers the Registrar General, if he so thinks fit, at the request and cost of any local authority or person, to cause abstracts to be prepared containing any such statistical information, being information which is not contained in the census reports made by him, and which in his opinion it is reasonable for that authority or person to require, as can be derived from the census returns.

This provision is available to meet any special demand for census statistics of a greater degree of elaboration, whether in respect of subject matter or area, than those given in the official reports. An estimate of the cost and an assessment of the practicability will be given on receipt of any requests of this nature.

Census 1951, Fertility Report

General Explanatory Notes

1. **General Note.**- This volume contains statistics from the 1951 Census of England and Wales on fertility of marriage, together with some based, in addition, on the sample Family Census taken in 1946 by the Royal Commission on Population and on the annual Vital Registration Statistics. They supersede the figures published in Part II of the *Census 1951, Great Britain, One per cent Sample Tables*. The differences between the final figures and those derived from the one per cent sample are discussed in Chapter 1 on p.xxv.
2. **1951 Census Population.**- The census enumerated population is that living and counted, in each area, at midnight, 8th/9th April, 1951. Persons enumerated on board vessels which were at that time in port or at moorings or anchorage in England or Wales or engaged in a coastwise or fishing voyage are included and classified, with as much accuracy as the information furnished allows, to the appropriate local areas.

The questions on fertility of marriage were addressed only to married women aged under 50 at the time of the census. They were not included on the special form of schedule which was used for members of the armed forces who were enumerated in defence establishments or on board naval vessels; as a result the small number of married women enumerated on those forms are entirely excluded from the census tabulations of fertility.
3. **Basis of Main Tables.**- The main tables in this volume are divided into five sections. Tables A to C analyse in detail the family sizes *as at census date*, 8th April, 1951, together with the fertility of the year ending on that date. Tables A and B are confined to married women under the age of 50 at the time of the census, and Tables C to those aged 45-49 (last birthday) at that time. Tables D and E trace the fertility experience of women married under the age of 45 at any time from 1920 to 1954 *during the whole course of their married lives* up to 1955 inclusive. The former are based on the tabulations of the census of 1951; the latter use, in addition, the other sources mentioned in Note 1.
4. **Children born before Marriage.**- Tables A to C relate to the legitimate fertility of women enumerated as married at the census, and are thus intended to exclude any children born to these women before marriage. It is likely, however, that a number of such children have been included in the census returns, and that not all of them could be detected and excluded from the tabulations. The tables of mean family size in Tables D, on the other hand, include the children born to married women before marriage, as recorded in the Family Census of 1946 and estimated thereafter.
5. **Understatement of Remarriage.**- For a number of women who had been married more than once this fact was not apparent from the statements on the census schedule. The resulting bias in the returns and the adjustments made to remove it as far as possible from the final tables are discussed in Chapter 1. Tables A to C, except Tables A.15 and 16, have been so adjusted. Tables D and E are not affected by the bias.
6. **Other Not Stated and Inconsistent Information.**- Married women who failed to state the date of their marriage or the number of children born to them (or both) were excluded from all the fertility tabulations. Women who gave an alleged date of marriage which was inconsistent with their age were also excluded, as were a small number who stated numbers of children born to them which appeared impossible for their ages. These excluded classes were not specifically counted; an estimate of their effect on the numbers in the samples tabulated is given on p.xxii.

Where the question on current fertility (whether or not the woman had borne a live-born child in the preceding year) had not been completed an

answer was inserted. This was "yes" if there was a child under 1 year on the schedule apparently born to the woman concerned and "no" in all other cases.

7. **Samples.**- Tables A and B are derived from a one fifth sample of the returns and Tables C from a four fifths sample, and have not been grossed up to the total numbers in the population. Exceptions are the tables relating to women married more than once. Of these, Tables A.7, 10 and 11 are based on complete counts which have been divided by five to bring them into scale with the one fifth sample of women married once only. Tables A.15 and 16 are also based on complete counts, but they have not been divided by five; nor have they been adjusted for the understatement of remarried women in the census. *The mean family sizes, fertility rates and proportions infertile in these two tables reflect the experience of such women better* than do Tables A.7, 10 and 11, owing to the approximate nature of the adjustments used which are, however, adequate for women married once only. The tables for *all* married women are based on the one fifth sample of once-married women and on the complete count of the remarried women divided by five.

8. **Definitions:-**

Marriage Duration in Tables A to C has been calculated from the calendar quarter of marriage. It therefore relates to duration as at 31st March, 1951, except for duration 0 (completed years), which includes all marriages from 1st April, 1950, to 8th April, 1951, inclusive. Durations as at census date are therefore strictly 8 days longer than those shown. The durations in Tables D and E are exactly as shown.

In the tables relating to all married women combined, whether married once or more often, marriage duration is taken as the time elapsed since the date of the first marriage.

Marriage Age in Tables A to C has been taken as the age last birthday at census less the completed years of marriage duration in the case of marriages which took place in October to March, and one year less in the case of those which took place in April to September.

The Difference between Husband's and Wife's Ages in Table B.5 is the numerical difference between their ages each taken in completed years.

Size of Family is the total number of children born alive to a woman. (See also Note 4.)

Current Fertility in relation to Tables A to C refers to children born alive in the year ended 8th April, 1951.

Fertility Rates in Tables A and B are the ratios of the numbers of women bearing a live-born child in the year ended 8th April, 1951, to the numbers of all women in the corresponding cell of the table.

'**Infertile**' as used in these tables relates to women who had not so far borne a (legitimate) live-born child.

The Standardised Ratios shown in Tables A to C are the ratios of the overall rates (mean family sizes, etc.) which would have occurred in the basic population with which comparison is made if it had been subject to the detailed rates of the sectional experience, to the overall rates which actually occurred. For further details see Chapter 2, p.xli, and Chapter 3, p.xliv.

9. **Conventions and Significance Indications.**- The following conventions have been used in Tables A to C and in text tables derived from them:-

Cell blank where impossible or excluded from the tabulation.

- Number, or denominator of rate, equal to zero.
- * Rate equal to zero (i.e. numerator zero, denominator positive).
- 0 Rate greater than zero but less than half of smallest unit shown.

Italics Mean family sizes based on less than 200 total children, fertility rates and proportions infertile based on less than 100 women bearing a child in the year ended 8th April, 1951, or infertile, respectively. In Tables A.7, 10 and 11 these rules apply to five times the numbers shown in the tables (i.e., to the full count). Comparative ratios follow their numerators, standardised ratios follow the corresponding unstandardised ratios.

These rules relate, very roughly, to figures for which the chance of a sampling variation as large as 20 per cent is at least 0.05.[†]

- * Mean family sizes based on less than 50 total children, fertility rates and proportions infertile based on less than 20 women bearing a child in the year ended 8th April, 1951, or infertile, respectively. In Tables A.7, 10 and 11 these rules apply to five times the numbers shown in the tables (i.e., to the full count). Comparative ratios have been omitted entirely where their numerators have been marked*. Standardised ratios follow the corresponding unstandardised ratios.

These rules relate, very roughly, to figures for which the chance of a sampling variation as large as 50 per cent is at least 0.05.[†]

10. **Areas for which Statistics are given.**- All figures in this Report for divisions of the country relate to persons enumerated in the areas concerned. (An outline map showing the boundaries of Standard Regions and Conurbations is included on p.xii.)

[†] For mean family sizes and their ratios the sampling variations are somewhat larger at marriage duration 0 years and also at marriage ages 40 and over.

Standard Regions.- The constitution of the English Standard Regions is as follows:-

Northern	Northamptonshire	London and South Eastern
Cumberland	Peterborough, Soke of	Essex, Part of ⁽⁶⁾
Durham	Nottinghamshire	Hertfordshire, Part of ⁽⁷⁾
Northumberland	Rutland	Kent
Westmorland		London
Yorkshire, North Riding		Middlesex
	Midland	Surrey
East and West Ridings⁽¹⁾	Herefordshire	Sussex, East
Yorkshire, East Riding	Shropshire	Sussex, West
Yorkshire, West Riding	Staffordshire	
	Warwickshire	Southern
	Worcestershire	Berkshire
North Western		Buckinghamshire
Cheshire	Eastern	Dorset
Derbyshire, Part of ⁽²⁾	Bedfordshire	Oxfordshire
Lancashire	Cambridgeshire	Southampton
	Ely, Isle of	Wight, Isle of
North Midland	Essex, Part of ⁽⁴⁾	
Derbyshire, Part of ⁽³⁾	Hertfordshire, Part of ⁽⁵⁾	South Western
Leicestershire	Huntingdonshire	Cornwall
Lincolnshire -	Norfolk	Devon
Parts of Holland	Suffolk, East	Gloucestershire
Parts of Kesteven	Suffolk, West	Somerset
Parts of Lindsey		Wiltshire

(1) Includes York C.B.

(2) Buxton M.B., Glossop M.B., New Mills U.D., Whaley Bridge U.D. and Chapel en le Frith R.D.

(3) All except the areas stated in ⁽²⁾ above.

(4) All except East Ham C.B., West Ham C.B., Barking M.B., Chingford M.B., Dagenham M.B., Ilford M.B., Leyton M.B., Walthamstow M.B., Wanstead and Woodford M.B., Chigwell U.D. and Waltham Holy Cross U.D.

(5) All except Barnet U.D., Bushey U.D., Cheshunt U.D., East Barnet U.D. and Elstree R.D.

(6) All areas stated in ⁽⁴⁾ above.

(7) All areas stated in ⁽⁵⁾ above.

Wales (including Monmouthshire).- Wales (including Monmouthshire) has been divided into two areas for these analyses. Wales I consists of the counties of Brecknockshire, Carmarthenshire, Glamorganshire and Monmouthshire; Wales II covers the remaining nine Welsh counties.

Conurbations.- The conurbation areas used in this Report are those which were agreed in 1950, under the aegis of the Interdepartmental Committee on Social and Economic Research and the Central Statistical Office, for the presentation of official statistics generally.* They each consist of an aggregation of entire local authority areas and are constituted as follows:-

Greater London:

<i>London A.C.</i>	<i>Surrey (pt.) - contd.</i>	<i>Herts. (pt.) - contd.</i>
<i>Middlesex A.C.</i>	Richmond M.B.	Cheshunt U.D.
<i>Surrey (pt.)</i>	Surbiton M.B.	East Barnet U.D.
Croydon C.B.	Sutton and Cheam M.B.	Elstree R.D.
	Wimbledon M.B.	
Banstead U.D.	<i>Kent (pt.)</i>	<i>Essex (pt.)</i>
Barnes M.B.	Beckenham M.B.	East Ham C.B.
Beddington and	Bexley M.B.	West Ham C.B.
Wallington M.B.	Bromley M.B.	
Carshalton U.D.	Chislehurst and Sidcup U.D.	Barking M.B.
Coulsdon and Purley U.D.	Crayford U.D.	Chigwell U.D.
	Erith M.B.	Chingford M.B.
Epsom and Ewell M.B.	Orpington U.D.	Dagenham M.B.
Esher U.D.	Penge U.D.	Ilford M.B.
Kingston upon Thames M.B.		
Malden and Coombe M.B.	<i>Herts. (pt.)</i>	Leyton M.B.
Merton and Morden U.D.	Barnet U.D.	Waltham Holy Cross U.D.
Mitcham M.B.	Bushey U.D.	Walthamstow M.B.
		Wanstead and Woodford M.B.

11. **Social and Socio-economic Classification.**- Since the 1911 Census it has been customary to arrange the very large number of unit groups of the Occupational Classification into a small number of broad categories (traditionally called Social Classes) as an aid to certain kinds of statistical analysis. Each occupational unit group has been assigned as a whole to the appropriate social class.

For certain investigations, especially fertility, it has been felt that the social class grading is not entirely adequate, and accordingly at the 1951 Census a different arrangement of occupational unit groups taken as a whole into slightly more sharply defined groups was introduced, the groups being called socio-economic groups.

The specific assignments of occupational unit groups to social classes and to socio-economic groups are set out in the *Census 1951, England and Wales, Occupation Tables*, and these should be studied for a full appreciation of their content. They are more fully described on pp.x and xi of that volume. Their general nature is indicated by the following broad descriptions:-

Social Class

Class I - Professional, etc., Occupations

Class II - Intermediate Occupations

Class III - Skilled Occupations

Class IV - Partly Skilled Occupations

Class V - Unskilled Occupations

Socio-Economic Groups

A. Agricultural	B. Non-Agricultural	
	I. Non-Manual	II. Manual
1. Farmers	3. Higher administrative, professional and managerial	9. Foremen
2. Agricultural workers	4. Other administrative, professional and managerial	10. Skilled workers
	5. Shopkeepers (including proprietors and managers of wholesale businesses)	11. Semi-skilled workers
	6. Clerical workers	12. Unskilled workers
	7. Shop assistants	
	8. Personal service	
C. Special group not included elsewhere		
13. Armed Forces (other ranks)		

The detailed composition of the social classes and socio-economic groups in terms of occupation groups is given in the *Census 1951, England and Wales, General Report*, Appendix C.

In this Report, women who were enumerated with their husbands and whose husbands stated that they followed or were retired from a gainful occupation (including those out of work but seeking work) are classified according to the Social Class or Socio-economic Group appropriate to that occupation.

13. Industry Groups.- The Industry groups identified in Table C.6 of this Report each comprise one or more Orders or Minimum List Headings of the census industry classification (see *Census 1951, Classification of Industries*), which are the same as those of the *Standard Industrial Classification*. The assignments are made according to the industry in which the woman's husband was (or had formerly been) occupied. The constitution of the groups is as follows:-

INSTRUCTIONS

Fold this page back for guidance while filling up Columns B, C and Panel T.

Relationship. Column B.

1. Visitors. Anyone who has a more usual residence elsewhere should be described as " Visitor ", whether related to the Head of the Household or not.

2. Residents. Persons enumerated at a hotel, club, hostel, boarding-house, etc., at which they have a settled residence without a more usual place of residence elsewhere, should be described as " Resident " or " Boarder ", not as " Visitor ".

Usual Residence. Column C.

3. Visitors from abroad, unless they have a settled residence in this country, should give their full postal address in the country overseas where they normally reside.

4. Hotels, Boarding-Houses, etc. For persons enumerated at a hotel, club, hostel, boarding-house, etc., at which they have a settled residence without a more usual place of residence elsewhere, write " Here ".

5. Resident Staff, etc., who " live in ". The private house, boarding-house, or other premises where they live in should be regarded as their usual residence. If enumerated at their living-in premises, write " Here ". If enumerated elsewhere, their living-in address should be given as their usual residence.

6. Scholars, Students, Undergraduates, etc., of a residential school, college or university, if enumerated at home, should give the address of the boarding school or college at which they usually reside during term. University students who reside during term in lodgings in the university town should regard such lodgings as their usual residence for this purpose.

7. Members of His Majesty's Forces on leave should give the name and address of their barracks, quarters, station or shore establishment.

For instructions on Columns N-R see numbers 13 to 23 on the page behind Columns A, B and C.

Household Arrangements : Panel T.

8. Piped water supply within the house means water laid on either from the mains or from a storage tank, if the tap can be reached without leaving the shelter of the building or an attached covered structure. It does not include a tap in the open yard or a public standpipe.

9. Cooking Stove or Range means any cooking stove, kitchen range, or other fixed grate using gas, electricity or any other fuel, provided there is an oven. One or more gas-rings, hot-plates or portable electric ovens are not by themselves enough to be called a cooking stove or range.

10. Kitchen Sink means a sink inside the building, whether in a kitchen or not, with a drain pipe leading outside the building, and normally used for washing up, etc. It need not have water piped to it. It does not include a wash basin designed for personal toilet.

11. Watercloset here means a watercloset flushed by water, either from a cistern or by hand, and emptying into a main sewer, septic tank or cesspool. It does not include a chemical closet or earth closet.

12. Fixed Bath means a bath permanently installed and connected with a waste pipe leading outside the building. It does not matter for this purpose whether there is water piped to it, or whether the room where it is installed is used only as a bathroom or not.

EXAMPLE

For a household with the exclusive use of a gas cooker, a kitchen sink without a tap, and a watercloset, but drawing water from an inside tap used also by another household, and having no fixed bath, the entries would be :—

Piped water supply within the house	Cooking Stove or Range	Kitchen Sink	Water Closet	Fixed Bath
S	E	E	E	None

E

CENSUS, ENGLAND, 1951

SCHEDULE

Prescribed by Regulations under the Census Act, 1920, as the form to be used in England (excluding Monmouth), for the purpose of returns in respect of (a) Private Households, (b) Hotels, Clubs, Boarding-houses or Common or other Lodging Houses, and (c) Other persons in respect of whom no other form of schedule is prescribed.

This space to be filled up by the Enumerator.

No. of Registration District	No. of Registration Sub-District	No. of Enumeration District

Name of householder or other person responsible for making the return

Postal Address

NOTICE

1. The Head, or person acting as Head, of a private Household is required by law to make a return in this form in respect of all persons (members of the household, including visitors, employees and boarders) who are present at midnight on the night of Sunday, 8th April, 1951, in the dwelling, and all persons who arrive at the dwelling and join the household on Monday, 9th April, 1951, before the collection of the schedule, and who have not been enumerated elsewhere.

Note.—Any one or more persons separately occupying a house or part of a house, flat, apartment, etc., will be regarded as a separate household for Census purposes. Persons who board with a household will be regarded as part of the household with which they board.

2. The manager or other person in charge of a hotel, club, hostel, boarding-house or common or other lodging house is required by law to make a return in this form in respect of all persons who are to be regarded as residents or members of the establishment for Census purposes, namely, all who are present at midnight on the night of Sunday, 8th April, 1951, in the establishment, and all persons who join the establishment on Monday, 9th April, 1951, before the collection of the schedule, and who have not been enumerated elsewhere.

3. Every such person is required by law to give to the person responsible for making the return such information as may be necessary to enable the return to be made. No use may, however, be made of such information by the person to whom it is given except for the purpose of making the return.

4. A person who has applied in the prescribed manner to make a separate confidential return will not be liable to give information to the Head or the Manager ; and in such case the person responsible for making the return will only be liable to include in his return in respect of that person the particulars required in Columns A and B within.

5. The schedule will be called for on MONDAY, 9th APRIL, by the appointed enumerator ; in order that he may not be delayed it must be ready with the answers written in the proper columns early on the morning of that day. If the answers appear to be incomplete or inaccurate, the enumerator must ask any questions necessary to enable him to correct the schedule.

6. The person responsible for making the return may, if unable to deliver the schedule to the enumerator personally, arrange for some other person to do so on his behalf. If desired, the schedule may be handed to the enumerator under cover.

7. If any person whose duty it is to make a return or to give information refuses to do so, or wilfully gives false information, or uses otherwise than for the purpose of making the return any information given him for that purpose, he will be liable to a fine not exceeding Ten Pounds.

8. The contents of the schedule are strictly confidential.

GEORGE NORTH,
Registrar General.

EXAMPLES OF COMPLETED SCHEDULES

NAME AND SURNAME	RELATIONSHIP TO HEAD OF HOUSEHOLD	SEX	AGE	F	PARTICULARS AS TO MARRIAGE			BIRTHPLACE	NATIONALITY	EDUCATION	PERSONAL OCCUPATION	EMPLOYER AND EMPLOYER'S BUSINESS	PLACE OF WORK
					G	H	K

INSTRUCTIONS

Fold this page back for guidance while filling up Columns N-R.

Education. Columns N and O.

13. Column N. Full-time at an educational establishment means such time as leaves no reasonable opportunity for substantial regular employment in term-time.

14. Column O. Give the age at which full-time attendance (see Instruction 13) finally ceased even if still attending part-time. No entry is required for retired persons, for persons not following or seeking to follow an occupation for payment or profit, or for those National Servicemen who intend to resume full-time education on their release.

Occupation and Industry. Columns P and R.

15. Occupation. An entry must be made in Column P for everyone aged 15 or over. For persons following an occupation for payment or profit, state fully and definitely the usual occupation by which the living is mainly earned (see Instruction 22). If the job is known in the trade or industry by a special name, use that name. Managers, foremen, etc., should give the department or branch where applicable (for example, "sales manager", "manager of clothing department", etc.).

16. Out of Work. For a person who is out of work but seeking work, enter the particulars of his usual occupation and industry in Columns P and R, and put "Out of work" at (b) in Column P, but for a young person who is seeking work but has never had a job, or for a person who is incapacitated from following his previous occupation and is seeking another, put "None" at (a) in Column P, and "Out of work" at (b).

17. Retired persons. A retired person who has taken up regular work again should give the present occupation, and should not be described as "Retired".

18. Part-time. The description "Part-time" should not be used where the paid employment or work normally occupies 30 hours a week or more.

19. Unpaid Helpers in a Family Business. For a member of a household who is chiefly occupied in giving unpaid help (i.e. without receiving a definite wage or share of the profits) in a business carried on by the head of the household or other relative state the occupation in Column P, adding "Unpaid", and complete Columns R and S treating the head of the business as employer. Do not include persons whose help is given in private domestic duties only.

20. Home Duties. For anyone chiefly occupied in unpaid domestic duties at home, write "Home Duties" in Column P and leave Columns R and S blank.

21. Other persons without an occupation for payment or profit. For persons permanently incapacitated by illness, etc., who have never followed any paid occupation, write "None" in Column P and leave Columns R and S blank.

22. Inadequate descriptions.

The following are too vague, and must not be used by themselves : Scientist, Technician, Civil Servant, Clerk, Engineer, Inspector, Checker, Foreman, Overlooker, Operative, Factory Hand, Labourer, Mill-Hand, Machinist, Assistant, Contractor, Collector, Polisher, Coal Miner, etc.

Labourers. For an unskilled worker usually employed on one sort of work alone, give also the sort of work done, for example, "Bricklayer's Labourer". If accustomed to work at various jobs, write "General Labourer". (See 1-3 below.)

Machine Operators. Always state the kind of machine, giving its recognized name, if any. (See 5-6 below.)

Shopkeepers, Retail Dealers, Shop Assistants. If wholly or mainly engaged in selling, add "Dealer" (if principal) or "Shop Assistant" or "Salesman" (if assisting), and state whether the business is wholesale or retail (or both). If, however, mainly making, though also selling, add "Maker". For shop assistants and salesmen in Stores with several departments, state the particular department in which engaged. (See 17-22 below.)

Coal, etc., Mine Workers. State occupation precisely and add whether above or below ground. If a hewer or getter, state whether hand or machine. (See 12-14 below.)

Farm Workers. For everyone (including relatives of the Head of the Household) following a definite occupation on a farm (such as bailiff, shepherd, cowman, tractor driver, etc.), state that occupation. But if, for instance, a farmer's son is helping in the general work or management of the farm, write "Assisting Father in general farm work". (See 15-16 below.)

Navy, Army, Air Force. For men and women of His Majesty's Forces on leave, state their rank in Column P and the arm of the Service in Column R. "National Serviceman" should be added at (b) in Column P, if appropriate.

Civil Service. For non-industrial civil servants, state rank, Department and Branch in which serving.

23. Employer and Employer's Business. The particulars about employers are required solely to assist classification of the industry or service.

Describe the business fully ; the following terms are insufficient by themselves :—Manufacturer, Merchant, Agent, Broker, Factor, Dealer, Engineering, Iron Works, etc.

Domestic Servants. If in private service state the occupation in Column P (for example, "Cook") but write only "Private" in Column R. But complete Columns P and R as usual for persons employed in hotels, restaurants, boarding-houses, etc.

EXAMPLES OF ENTRIES IN COLUMNS P AND R

Column P.	Column R.	Column P.	Column R.
1. (a) Dock labourer	(a) Mersey Docks and Harbour Board	12. (a) Getter (machine) (below ground)	(a) N.C.B.

STRICTLY CONFIDENTIAL

Please read the Column Headings below and the Instructions and Examples on the back. Then fill up the Schedule carefully in Ink.

To be filled up by the Enumerator.

No. of Schedule.

The Persons to be included in this schedule are all those who are alive at midnight on the night of Sunday, 8th April, 1951, and who, whether as members of the family or as visitors, boarders or employees :—
(1) pass the night in the dwelling of this household or in this establishment, or
(2) arrive and are received into the household or establishment on Monday, 9th April, 1951, before the collection of the schedule, not having already been enumerated elsewhere.
No one else may be included.

Name and Surname

Relationship to Head of Household

Usual Residence

See note above for the persons to be included.

For the order of entering names, see Examples on the back.

For newly born infants who have not yet been given a name, write "Baby" followed by the surname.

State whether "Head" or "Wife" "Son" "Mother" or other relative, "Visitor" "Boarder" "Employee" etc. See Instructions 1 and 2.

(1) For persons included in this schedule who usually reside at this dwelling or establishment, write "Here".
(2) For those who have a more usual residence elsewhere, state full postal address of usual residence.
(3) For those who have no settled place of residence, write "None".
See Instructions 3 to 7.

Sex

Age

Particulars as to Marriage

State for each married woman under age 50 included in this schedule.

Date of Marriage

Children born in Marriage

For persons aged 16 or over state whether "Single" "Married" or "Widowed", or, if marriage dissolved by divorce and not since remarried, write "D".

The month and year of her present marriage at (a).
If married more than once, state also the month and year of her first marriage at (b).

The total number of children born alive to her (including any of a previous marriage and any that have died).
If none, write "None".

Whether she has given birth to a live-born child during the last twelve months, i.e., on or after 9th April, 1950. ("Yes" or "No").

Birthplace

Nationality

Education

Occupation and Industry

To be answered only in respect of persons aged 15 or over. Vague or indefinite terms (see Instruction 22) must not be used.

14. Terminal Education Age.- Terminal education age means the age at which full-time attendance at a school, university or other educational establishment for the purpose of receiving instruction finally ceased. Only persons following a gainful occupation (including those out of work but seeking work) were asked to reply to this question. Thus in Table C.5, where classification is by husband's terminal education age, women whose husbands had retired or did not state a gainful occupation are omitted.

15. Census Schedule.- A copy of the census schedule E is included opposite p.xiv.

Commentary

CHAPTER 1: INTRODUCTION

1. Purpose and Previous Enquiries

The subject of human fertility, of the number of children people have, is one of great interest in our time. As a basic part of human life and behaviour it is intrinsically of concern for the study of man in society to which so much effort is being directed. More than that, since it is from the new-born children that mankind recruits itself, the pattern and trend of fertility determines to a considerable extent the future numbers and structure of the population, both in general and in particular groups; and these developments in turn have an impact on the national economy. The study of fertility is therefore of very practical significance.

It is normal for children to be born and to grow up within a family, and in this country 95 per cent of all live births occur within marriage. The present volume is thus concerned almost entirely with fertility of marriage.*

The 1951 Census of Population was only the second one in this country at which fertility questions were asked. The first, a pioneering venture, was the Census of 1911. After that very little current information on fertility was collected until the Population (Statistics) Act, 1938, greatly extended the data obtained at birth registration. When the Royal Commission on Population was appointed in 1944 they found it necessary, in order to discharge their task, to take a special Family Census. Their enquiry covered a ten per cent sample of women in Great Britain who were or had been married. It took place in February, 1946, and the preliminary results greatly contributed to the Commission's conclusions; the final report was published in 1954.† Because the enquiry was confined to fertility questions, it was possible to ask for more details than in a general population census, and in particular for the date of birth of each child. On the other hand the Family Census unavoidably had to be conducted in such a way that cross-tabulation of fertility characteristics with others such as occupation could not be made in any detail, so that differential fertility analysis was severely restricted and had to be made in units not strictly comparable with those identified in the general census of population.

The enquiry took place before many of the births postponed during the war had been made up. By 1951 the making-up was for all practical purposes complete, so that the fertility recorded up to census date would be expected to present a more normal picture than in 1946 for marriages of which the fertility was not yet complete at the time of the Family Census. New census information was also needed to provide a firm base, after the disturbed war and post-war years, for the annual estimates used to calculate fertility rates and mean family sizes from birth registration statistics.

* It is customary in English demographic usage to reserve the term fertility to births which actually take place. A woman's ability to bear children, whether or not realised in practice, is called fecundity.

† *The Trend and Pattern of Fertility in Great Britain. A Report on the Family Census of 1946.* By D.V. Glass and E. Grebenik. Papers of the Royal Commission on Population, Volume VI. London, Her Majesty's Stationery Office, 1954.

2. The Questions

The questions in the 1951 Census Schedule bearing most directly on fertility, in addition to those on sex, age at census, and whether single, married, widowed or divorced, were as follows:-*

State for each married woman under age 50 included in this schedule.			
Date of Marriage		Children born in Marriage	
The month and year of her present marriage at (a).		The total number of children born alive to her (including any of a previous marriage and any that have died).	Whether she has given birth to a live-born child during the last twelve months, i.e., on or after 9th April, 1950 ("Yes" or "No".)
If married more than once, state also the month and year of her first marriage at (b).		If none, write "None".	
G		H	K
Month (a)	Year		
...	...		
(b)			

The questions were applied only to women, as is usual in enquiries of this sort, because biologically fertility is more closely dependent on such characteristics of the mother as her age than of the father, and in order to reduce the complexity of the tabulations, already considerable. But where the husband was enumerated on the same schedule, and the woman had only been married once, his characteristics, such as age and social class, could be combined with hers in the tabulations where needed.

The questions were also confined to married women who were under the age of 50 at the time of the census. This was done to reduce the burden of response on the public, as well as that of tabulation, information about older women being available from the 1946 Family Census, at which their fertility would have been complete for all practical purposes. Against this saving had to be weighed a disadvantage to the differential fertility tabulations for sections of the population. Since it was not practicable to ask for, or tabulate by, the date of birth of each child, the most meaningful comparisons between different groups are those of completed fertility. Excluding women over 50 at census meant that such comparisons could only be made for those aged 45-49 at census (Section C of the Tables), who were married at widely different periods according to their age at marriage. However, there was reason to believe, from the Family Census results, that for the bulk of the women in question, viz., those married after about 1922, the changes between groups of marriage cohorts were relatively moderate. As for the analysis of the changes over time in the fertility of the general population, it has been possible to link the data from the Royal Commission's Family Census of 1946, the Census of 1951 and the annual birth registrations into a continuous series, shown in Sections D and E of the Tables.

* These questions were not included in the schedule used for persons belonging to the Naval, Military, or Air Forces of the Crown (including the Women's and Nursing Services), enumerated in vessels or premises under Naval, Military or Air Force discipline.

3. Primary Characteristics

The primary question was that about the total number of children born to a woman by the time of the census, which may also be called the size of her family. Family size in this sense, as a measurement of fertility, is to be distinguished from related concepts such as the living members of the biological family including the parents, and the various groupings of people living together which are analysed in the tables on the composition of private households shown in the Housing Report* and the One per cent Sample Tables†.

A special case of family size is that of women who at the time of the census had not so far had a live-born child. For the sake of brevity they are called "infertile" in this volume, consistently with the definition of fertility as relating to performance and not to biological ability.

The question as to whether a woman bore a child in the year ending on census date, relating to what may be called her current fertility, was asked mainly for the purpose of measuring differentials between different sections of the population. Any weaknesses in the data so collected compared with those obtained at birth registration are probably far outweighed, for this purpose, by the fact that numerators and denominators of the resulting fertility rates are automatically strictly comparable. When birth registration data relating to occupational and other groups are related to census data of the number of women at risk serious problems of comparability can arise, in addition to the extra labour of coding, punching and tabulation. Moreover the census question allowed analysis by characteristics which cannot be obtained at birth registration, such as the difference between the parents' ages.

4. Derived Characteristics and Cross-classifications

The data on family size and current fertility have been tabulated in combination with other characteristics of the parents. Some of them are stated directly on the census schedule. The first of these is, of course, the *age of the mother at the time of the census*. Others can be derived from the answers to the schedule questions. Thus the date of the woman's marriage (and that of her first marriage in the case of those married more than once) being stated in terms of calendar year and month, the *duration of marriage* in completed years can be obtained by subtraction. (Strictly this gives marriage duration at 31st March, 1951. The further 8 days to census date have been ignored for this purpose.)

The woman's *age at marriage* can be obtained by subtracting the marriage duration from the census age. It can be done with some accuracy if the months of age and of marriage are used, but in practice it was enough, and more economical, to use the census age in completed years and the marriage duration in half years, as follows:-

Census Age (last birthday)	Marriage Duration (exact years at 31.3.1951)	Calculated Marriage Age (last birthday)
X	(Y to $Y+\frac{1}{2}$ $Y+\frac{1}{2}$ to Y+1	X-Y X-Y-1

In the case of *women married more than once*, both age at, and time since, marriage can be considered either according to their current or their first marriage. Some tables have been provided on both bases, and can be compared with those for women *married once only* or those for all women (which take account of the first marriage).

* Census 1951, England and Wales, Housing Report.

† Census 1951, Great Britain, One per cent Sample Tables, Part II.

For women enumerated with their husbands, differential fertility was analysed by the *difference between husband's and wife's age*, by the *social class* or *socio-economic group* which included the husband's occupation, by the *industry group* in which he worked, and the *age* up to which he had had full-time education. Other analyses related to the *region* or degree of *urbanisation* of the area in which they were enumerated and the latter as well as industry group and education have been further cross-classified with socio-economic group.* These tabulations were produced from the machine cards relating to the husbands, on which some of the wife's characteristics were punched; this independent processing may have resulted in some slight discrepancies between these tables and those derived from the wife's card.

A separate tabulation was also made for *occupied married women*.

5. Samples

7.4 million married women under the age of 50 were enumerated in England and Wales at the 1951 Census, of whom 1.3 million were aged between 45 and 50. To reduce the work caused by the extensive tabulations the fertility analyses were carried out on two samples of the machine cards - a one fifth sample of married women under 50 for the general analysis and a four fifths sample of those aged between 45 and 50 for the analysis of completed fertility. An exception was women married more than once who were tabulated in full.

Both samples were selected systematically by reference to the last digit of the household schedule number in the case of Ordinary Enumeration Districts and of the line number of all schedules in the case of Special Enumeration Districts†. Those ending in digits 3 and 8 made up the one fifth sample and the remainder the four fifths sample.

The resulting data were enough for the purpose in hand. Nevertheless there were bound to be cells with small frequencies, especially at the edge of the distributions and in highly cross-classified tables. In such cases the rates, ratios, etc. have been printed with the significance indications given in the General Explanatory Notes on p.viii.

6. Response

(a) *Remarriage*.— As was to be expected the answers to the census questions were not always complete or accurate. The most serious deficiency in the data on marriage and fertility was frequent failure to state the date of first marriage for women who had been married more than once. The schedule asked for this date "if (the woman was) married more than once", but there was no direct question as to whether she had been married more than once (yes or no). As a result women for whom the information was not given appeared to have been married once only, which seriously distorted many of the census figures.

Of the married women under age 50 at the Census only about 4.1 per cent had been married more than once.‡ An estimated 16 per cent of these, or 0.65 per cent of all married women under 50, failed to state their first marriage date. That may seem a trivial proportion which could safely be ignored. But this is far from being so, because the distribution of these women by age at, and duration of, current marriage and number of children is quite different from that of the once-married. They are, of course, heavily concentrated at the higher marriage ages where the once-married are relatively few in number, and where the mean family size of the remarried is much larger than that of the once-married.

Table 1.1 compares the proportions of women shown on the schedules as married more than once with those which would be expected for each age-group at, and duration of, the current marriage on the basis of the

* For the definition of all these groups, areas, etc., see General Explanatory Notes on p.viii.

† Special Enumeration Districts consisted of large institutions.

‡ Proportion estimated with the help of marriage registration statistics.

corresponding marriage registration statistics. It shows that the deficiency of the stated remarried, 16 per cent for all ages under 50 combined, varies little with marriage age but rises to 30 or even 40 per cent at long durations of the current marriage.

Table 1.1. - Comparison of Proportions of Women giving more than One Marriage Date with those Expected from Marriage Registration Statistics

Age at Current Marriage	Duration of Marriage (completed years)															
	All	0	1	2	3	4	5	6	7	8	9	10-14	15-19	20-24	25+

45 - 49	9	9	9	11	9	4										

+ Negligible numbers married more than once.

For the measurement of fertility and differences in it the more important errors are those caused in the figures for all married women (analysed by first marriage) and particularly for those married once only. Table 1.2 shows the approximate percentage inflation of the apparent total number of once-married women due to failure to state the first marriage date for some remarried women.

Table 1.2. - Approximate Inflation of Number of Women Married Once Only due to Understatement of Numbers Married More than Once

(Per cent in each cell)

Age at Marriage	Duration of Marriage (completed years)														
	All	0	1	2	3	4	5	6	7	8	9	10-14	15-19	20-24	25 and over
All under 50	1	1	1	2	2	1	1	1	1	1	1	1	0	0	0
Under 20	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
20 - 24	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
25 - 29	1	2	2	2	3	2	2	2	1	1	1	1	1	1	
30 - 34	4	5	5	7	7	6	5	4	4	3	3	3	3		
35 - 39	7	8	7	8	9	7	6	7	7	6	6	7			
40 - 44	11	13	11	12	12	9	10	10	12	9	7				
45 - 49	12	12	12	15	12	2									

It rises with marriage age, since the proportion of remarriages among all marriages rises similarly, and does not vary much with duration within a marriage age group, except that it tends to be slightly higher at short durations reflecting the post-war marriages of war widows and particularly of the increased number of divorced women. The error is negligible at marriage ages under 30, but averages 4 per cent at marriage age 30-34 and reaches 15 per cent at marriage age 45-49, duration 2.

The point of real consequence is the difference made to such measures as mean family size, shown in Table 1.3. The percentage inflation of mean family size among once-married women rises with marriage age as a result of the increasing inflation of their numbers; it is also very much greater at short than at long durations, because the very small family sizes of the once-married in their first few years of married life are distorted by the inclusion of women with many years of marriage and motherhood behind them. The resulting percentage errors, admittedly in small absolute numbers, are quite startling in the first year of marriage, reaching 14 per cent even at marriage age 25-29 and rising to several hundred per cent at marriage ages over 40. At later durations there is naturally a rapid decline, but even after 10-14 years of marriage the excess is still 17 per cent at marriage age 35-39, and at 40-44 it is 79 per cent after 7 years. Moreover these figures (as well as those in Table 1.2) are likely to err if anything a little on the low side, owing to the method of estimation which had to be used.

Table 1.3. - Approximate Inflation of Mean Family Size of Women Married Once Only due to Understatement of Numbers Married More than Once

(Per cent in each cell)

Age at Marriage	Duration of Marriage (completed years)														
	All	0	1	2	3	4	5	6	7	8	9	10-14	15-19	20-24	25 and over
All under 50	0	11	3	2	1	1	1	0	0	0	0	0	0	0	0
Under 20	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
20 - 24	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
25 - 29	1	14	4	3	3	1	1	1	1	0	0	0	0	1	
30 - 34	4	34	12	11	8	6	5	3	4	2	3	3	3		
35 - 39	17	72	24	19	20	13	11	14	13	15	14	17			
40 - 44	91	183	111	94	105	72	73	66	79	54	38				
45 - 49	185	450	213	132	95	19									

The existence of this problem was brought to light by the analysis of the fertility data from the One per cent Sample*. It was clear that, in spite of the tiny fraction of the total number of married women affected, the bias imparted to the data was too great to be tolerated. It was therefore decided to adjust all the raw data on the following assumptions:-

- (i) that the proportion remarried among all women enumerated who entered their current marriage at a given age and in a given calendar period was the same as that shown by the original marriage registration statistics;
- (ii) that the family size distribution and current fertility of women whose remarriage had not been stated was the same as that of women known to be remarried who had entered their current marriage at the same age and in the same calendar period;
- (iii) that the distribution of the "not stated" cases by duration of (and hence also age at) first marriage was the same as that of the stated for any given census age and family size, irrespective of date of current marriage.

* See below, p.xxv.

These are the only reasonable assumptions which could be made, at any rate if the work of adjustment was to be kept within bounds, but they are obviously subject to error, especially (ii) and (iii). Moreover the method adopted for solving the very considerable problem of ensuring consistency between the various adjusted tables, allowing for the difference in scale between the sample data of the once-married and the full tabulations of the remarried, resulted in some bias tending to an under-estimate of the family size of the "not stated" remarried. Nevertheless the tables for the once-married and for all married women combined, as now presented, are probably sufficiently free from the bias imparted by this response failure for all practical purposes, except perhaps at the relatively unimportant marriage ages over 40, where the family sizes at short durations in particular are probably still overstated to an appreciable, though reduced, extent.* They are certainly much more usable than the raw data. For remarried women Tables A.15 and A.16 show the unadjusted data from the full (100 per cent) tabulation, which give mean family sizes, fertility rates and proportions infertile unaffected by the weaknesses of the adjustment procedure.

(b) *Other Not Stated or Inconsistent Information.*— Sometimes a question on the schedule had not been answered at all, or the answers to several questions were patently inconsistent. Such cases had to be excluded from the tabulations altogether. Examples are failure to state the calendar year of marriage† or the total number of children, or statements of age at census and year of marriage which implied an impossibly young age at marriage. About 5 per cent of the women in the samples were excluded in this way.

Hence the effective sample size came to be as follows:—

	Millions (Figures are rounded and may not add to totals)
<i>Age at Census under 50 (One fifth Sample)</i>	
Total women enumerated (full count)	7.39
Theoretical sample size ϕ	1.48
Rejected cases (not stated or inconsistent information), approximately*	0.08
Actual sample (all married women) ϕ	1.40
<i>Age at Census 45-49 (Four fifths Sample)</i>	
Total women enumerated (full count)	1.26
Theoretical sample size ϕ	1.01
Rejected cases (not stated or inconsistent information), approximately*	0.04
Remainder	0.97
Married more than once, approximately	0.05
Married once only, not enumerated with their husbands	0.06
Actual sample (married once only and enumerated with their husbands)	0.85

ϕ Including one fifth of the number married more than once.

* Residual; includes sampling error amounting at most to a few thousand.

(c) *Premarital Births.*— The question about the total number of children ever born alive to a married woman was of necessity confined to those born in marriage. Hence, at the scrutiny of schedules before tabulation, answers which clearly implied more children than could have been born since the stated date of (first) marriage tended to be regarded as inconsistent and the cases excluded. In fact, however, the natural thing to do for a family some of whose children were born before the marriage, especially if they are at home and enumerated on the schedule, would be to include them all. There is evidence to show that this probably happened quite often.

* The residual overstatement does not apply to Tables D and E.

† If the year but not the month of marriage was stated the month was taken to be in the half year April to September, i.e. the middle part of the year.

Again, failure to state the date of an earlier marriage would tend to make some stated births look either inconsistent or bound to have occurred before marriage, when in fact they would merely have occurred before the *current* marriage. On the other hand such cases would tend to be eliminated by the schedule revisers, while many others, less obvious ones, would not. On balance the actual figures are practically bound to include some, but not all, premarital births to married women.

The average number of such births to women married once only was found at the Family Census of 1946 to be as follows:-*

Age at Marriage	Calendar Year of Marriage		
	1937	1940	1945
Under 20	0.031	0.016	0.035
20 - 24	0.026	0.016	0.033
25 - 29	0.032	0.019	0.054
30 - 34	0.049	0.040	0.079
35 - 39	0.080	0.075	0.089
40 - 44	0.082	0.132	0.108

There is some evidence that the average number included in the 1951 Census tabulations may be about half the total suggested by these figures.

(d) *Mis-statements associated with Premarital Conceptions.*- There is a natural reluctance at fertility censuses to reveal that a child born in marriage was conceived before it. This was particularly noticeable at the 1911 Census, where the form of the question (duration, not date, of marriage) drew the attention of those answering it to the matter. As a result a number of women overstated their marriage duration, and a short-fall of marriages at stated duration under one year was very noticeable at the young marriage ages where such cases are frequent.† At the 1946 Family Census, which was a voluntary enquiry, there seems to have been a tendency for women who had, after their marriage, borne a child conceived before it, to refuse to complete the schedule. At any rate the figures for marriages before 1940 point strongly in that direction.

It is therefore not surprising that some mis-statements due to the same cause seem to have occurred at the 1951 Census. But they appear to be a good deal less important than on earlier occasions, and to vary less consistently with Social Class than in 1911.

* These figures may themselves be understated as a result of response bias, though no evidence on the matter is available.

† Some of the overstatements probably occurred among women whose wedding anniversary fell soon after census day. They may have given in all good faith the duration at the *next* instead of the last anniversary because it seemed to them more "correct", in spite of the wording of the question ("completed years the present marriage has lasted"). A similar tendency was noticed for age statements. But this type of error does not account for the large and systematic variation with marriage age shown in Table 1.4.

Table 1.4. - Percentage Ratios of the Distribution between the First Five Years of Marriage of Women Enumerated at Census to the corresponding Distribution of Marriages Registered

(All married women by age at, and duration of, current marriage. Figures for 1911 are limited to women enumerated with their husbands.)

Age at Current Marriage	Duration of Current Marriage (completed years)				
	0	1	2	3	4
1951					
All under 45	95.9	100.7	100.2	100.6	102.6
Under 20	93.4	100.6	100.3	102.5	103.9
20 - 24	95.5	100.8	100.1	101.2	102.5
25 - 29	96.2	100.1	99.8	100.1	103.4
30 - 34	97.7	102.1	99.8	98.4	102.1
35 - 39	101.0	101.0	100.7	97.8	99.9
40 - 44	101.0	100.9	104.1	96.5	97.8
1911					
All under 45	81.1	102.5	107.4	104.0	104.0
Under 20	59.0	102.0	110.6	112.0	112.2
20 - 24	81.2	103.2	107.7	103.3	103.1
25 - 29	86.6	102.1	106.4	102.7	102.0
30 - 34	86.3	100.4	106.3	102.1	105.0
35 - 39	85.8	103.2	104.3	105.5	101.2
40 - 44	86.1	104.9	107.3	98.6	102.5

As is well known there is a tendency for very young brides to mis-state their ages at marriage registration, and there are also age mis-statements in the census. Both are discussed in the *General Report*. It should also be remembered that a statement of earlier marriage date (or longer duration) than the true one leads to an apparent marriage age which is too young.* All this complicates the estimation of errors due to attempts to conceal premarital conceptions. But an approximate idea of their size, and of the improvement since 1911, is given by Table 1.4, computed as follows. Within each marriage age group the number of women enumerated at each of the first five years of their current marriage was expressed as a proportion of the total for the whole duration group under five years. (The 1911 figures in integral marriage age groups were estimated from the numbers by single year of age at census.) Similar proportions were calculated for the corresponding marriages as originally registered. Finally the census proportions were expressed as percentages of the marriage proportions.

In the absence of mis-statement these percentages would be expected to be about 100, with some tendency to be slightly larger at the shortest and slightly smaller at the longer durations, especially for the oldest marriage ages. In fact duration 0 was deficient in 1911 at all the marriage ages included in the table, the ratio being 81 per cent on average and as low as 59 per cent in the marriage age group under 20. In 1951 the deficiency was confined to marriage ages under 35, the average ratio being 96 per cent and that for the under-twenties 93 per cent.

The comparison of the numbers of children born in the year before the 1951 Census as stated at the census with those registered (Tables 2.20 and 2.21 on p.xxxvii) is rather less sensitive. It gives no evidence of understatement at duration 0 in the census.

(e) *Children Born in the Year preceding the Census.*- The quality of the data relating to children born in the year preceding the Census will be discussed in Chapter II in connection with the resulting fertility tables.

* This may account for the fact that in 1911, though not in 1951, the number of women enumerated at apparent marriage age under 20 and durations 1 to 4, as calculated for Table 1.4, was considerably in excess of the corresponding number of marriages registered. There was no excess at duration 0 or at older marriage ages.

7. Relation to the One per cent Sample Tables

The One per cent Sample Tables* contain a section of fertility tables for Great Britain and England and Wales. Being based on a much smaller sample of the returns than those in the present volume these tables naturally could not go into as much detail, particularly as regards the cross-classifications now given in Sections B and C. Even of the figures which were published many were subject to a fair amount of sampling variation, though the tables as a whole provided useful pointers.

But the chief difference between the two sets of figures lies in the adjustments for understatement of remarriage which have been applied to the final figures. The need for them was discovered when the One per cent Sample data, already published, were being analysed for the purpose of the annual fertility statistics; it means that at marriage ages over 30 (or, at longer durations, 35) these data are seriously biased and must be used with great caution, if at all.

* Census 1951, Great Britain, One per cent Sample Tables, Part II.

CHAPTER 2: THE FERTILITY OF MARRIED WOMEN IN GENERAL AS RECORDED IN 1951

1. Fertility by Age at Census

(a) *Distribution of Women by Age at Census and Duration of Marriage.*— The tables discussed in this chapter, all in Section A, are confined to characteristics of married women. They may usefully be set in perspective, therefore, by a glance at the joint distribution of married couples by husband's and wife's age at the census. This is given in Table 2.1 (the corresponding proportions are given in Table 2.2) which relates to couples enumerated on the same schedule* and shows their absolute numbers. It shows that both husbands and wives are fairly evenly distributed over the age range 25-60 which contains four fifths of the total in each case. In most five year groups of wife's age, about four fifths of husbands are either in the same five year age-group or the next higher one.

Table 2.2. - Proportional Age Distribution of Husbands and Wives
(Couples enumerated on the same schedule)

Age of Wife at Census	Per 1,000 Couples of All Ages	Per 1,000 Couples of any given Age of Wife at Census											
		Age of Husband at Census											
		All Ages	Under 20	20-24	25-29	30-34	35-39	40-44	45-49	50-54	55-64	65-74	75 and over
All Ages	1,000	1,000	0	29	95	110	127	132	125	105	158	92	27
Under 20	5	1,000	48	650	250	38	8	3	2	1	0	0	0
20 - 24	63	1,000	2	338	493	131	26	7	2	1	0	0	0
25 - 29	114	1,000	0	39	446	373	106	26	7	2	1	0	0
30 - 34	117	1,000	0	3	86	407	366	102	25	7	3	1	0
35 - 39	128	1,000	0	1	10	74	436	352	93	22	10	2	0
40 - 44	126	1,000	0	0	2	12	97	454	326	74	29	5	1
45 - 49	115	1,000	0	0	1	3	16	108	472	287	97	14	2
50 - 54	101	1,000	0	0	0	1	3	18	117	461	356	39	5
55 - 64	142	1,000	0	0	0	0	1	3	15	84	669	209	19
65 - 74	72	1,000	0	0	0	0	0	0	1	5	130	710	154
75 and over	17	1,000	0	0	0	0	0	0	1	2	16	232	749

Restricting the analysis to married women under age 50 at census date, to whom alone the fertility questions were addressed, Table 2.3 compares the age distribution of all such women according to the complete count with that in the one fifth fertility sample and with those of once-married and remarried women respectively. All these distributions are very similar, except that the women married more than once are, naturally, somewhat older than the others.

Table 2.3. - Age Distribution of Married Women under Age 50 at Census
(Per thousand)

Age at Census	All Married Women		Married once only (Table A.6)	Married more than once (Table A.7)
	Total Enumerated	Fertility One fifth sample (Table A.5)		
All Ages under 50	1,000	1,000	1,000	1,000
Under 20	8	8	8	0
20 - 24	97	95	98	10
25 - 29	172	173	175	117
30 - 34	175	177	175	218
35 - 39	191	190	190	222
40 - 44	187	187	186	214
45 - 49	170	170	168	219

* It does not distinguish between women married once only and those married more than once.

Table 2.4 gives the proportional distribution of married women under age 50 and of those in each census age group by time since (first) marriage, both for all women and for those married more than once. The older women, as would be expected, are concentrated at the longer durations, and so, age for age, are the remarried compared with the total.

Table 2.4. - Distribution of Married Women in Census Age Groups by Time since First Marriage

(Per thousand)

Age at Census	Marriage Duration (completed years)									
	All Durations	0	1	2	3	4	5-9	10-14	15-19	20 and over

5 - 6	41				100	41	24	19
7 - 9	9				31	9	4	4
10 and over	1				2	1	-	-

Of all the women in the sample, a little over 20 per cent had not yet had a child, about 30 per cent had had one child by census date, 26 per cent two children, 12 per cent three and 10 per cent four or more. The proportions with few children or none were naturally highest at young ages where marriage duration tends to be short; thus the proportion with no children fell from 58 per cent at age under 20 to 20 per cent at age 45-49, while that with three children rose from 0.3 to 13 per cent and that with four or more from 0 to 16 per cent. This change can be observed more directly by comparing a short duration such as 4 completed years (24 per cent childless, 7 per cent with three or more children) with a longer one such as 14 years (15 and 27.5 per cent respectively).

Within a census age group the increase in family size with lengthening duration is even more marked, because there a longer duration also implies a younger marriage age; for the same reason family size diminishes instead of increasing with increasing census age when marriage duration is held constant.

The same picture is presented, more concisely, by Table 2.6, which gives the mean family size at census date for each age and duration group. It is 1.68 children for all married women under 50, rising from 0.15 for those married less than a year to 1.81 after 10-14 years of marriage and 3.00 after 25 or more*, and from 0.47 for those under age 20 to 2.03 for those aged 45-49.

The corresponding proportions infertile (i.e. as yet without a child) are shown in Table 2.7.

Table 2.6. - Mean Family Size of All Married Women by Census Age and Duration of Marriage

Note:- In the case of women married more than once, marriage duration in this table means time since *first* marriage.

Age at Census	Duration of Marriage (in completed years)

* This last figure is not representative of *all* married women at this duration, since it relates to a group married under age 25, i.e. with a relatively high fertility.

(c) *Current Fertility.*- Table A.5 also shows the number of women who had a live-born child during the year to census date, and the corresponding fertility rates are brought together in Table 2.8*. It shows the typical pattern of fertility declining with increasing age and also (after the first year) with increasing marriage duration/. The overall rate was 89 per thousand married women under age 50, exactly the figure which would be expected from the annual vital statistics. The age rates are a little below those expected at the youngest ages (especially under 20) and a little above at those over 30. The duration rates also agree fairly well, with perhaps some tendency to be low at short durations after the first two, and slightly high at long durations and generally under age 20.

Table 2.8. - Fertility Rates of All Married Women by Census Age and Duration of Marriage

Note:- In the case of women married more than once, marriage duration in this table means time since first marriage.

Age at Census	Duration of Marriage (in completed years)

The distribution by birth order of the children born in the year before census date will be discussed in Section 2 of this chapter.

(d) *Women Married Once Only or More than Once.*- Tables A.1-3 and A.5 relate to all married women. Corresponding data for those married once only are given in Tables A.4 and A.6 and for those married more than once (by time since first marriage) in Table A.7.

The once-married are such a large proportion of the total that there is hardly any difference between their mean family sizes, proportions infertile or fertility rates and those shown for all women in Tables 2.6-8.

Table 2.9. - Mean Family Size of Women Married More than Once by Census Age and Time since First Marriage

Age at Census	Time since First Marriage (completed years)

45 - 49	2.08	-	-	-	*	-	*	0.50*	-	*	-	0.33*	0.12*	0.57	1.13

* It should be remembered that the ages and marriage durations in this table relate to census date, and not to the date when the children were born as in the annual vital statistics.

† The apparent exception at the longest durations within some of the lines is due to the fact that as it approaches the right-hand edge of the table the age-group becomes confined to fewer and fewer single years of age, which, moreover, are those corresponding to the very youngest marriage ages. In this part of a detailed table by single years of age fertility rates change more rapidly with marriage age than with duration, and the number of women at the individual ages making up the group increases very rapidly with age.

The remarried, however, are different, as can be seen from Tables 2.9-11. Within any age duration cell, and for a particular duration irrespective of age, their mean family size is smaller, and their proportion infertile larger, than that of the once-married (or of all women). This is to be expected, since duration in this table means time since *first* marriage, and therefore includes the intervals between first and later marriages. For all durations combined, however, the mean family size of the remarried is larger, and the proportion infertile smaller, within any one census age group and for all ages combined, reflecting the fact that they are concentrated at longer durations (and older ages).

The fertility rates of the remarried at any given interval after their first marriage, with or without distinction of age, are generally larger than those of the once-married, and the same is true of the age rates for all durations combined. Nevertheless the overall rate, at 81 compared with 89 per thousand, is smaller, owing to the different distribution of these women by age and duration.

2. Fertility by Age at Marriage

(a) *Distribution of Women by Marriage Age and Duration.*- Tables A.8-16 and those of later sections analyse the fertility of married women by age at marriage instead of at census. The proportional distribution of these women by marriage age is given in Table 2.12, for all married women (by age at first marriage), the once-married and the remarried, the latter by age at both first and current marriage. It should be remembered that these distributions, which relate to all durations combined, are more heavily weighted towards the younger marriage ages than is the total population of such women, because they exclude all women over age 50 at census.

They serve to establish, however, that the distribution of once-married women, and of those among them who were enumerated with their husbands, is very close to that of all married women, about 15 per cent having married under age 20, 54 per cent at 20-24, 23 per cent at 25-29 and 8 per cent at 30 or over. The distribution of remarried women under age 50 at census is naturally different, being more concentrated at younger ages of first marriage and spread much more over older ages of current marriage.

Table 2.12. - Distribution of Married Women under Age 50 at Census by Age at Marriage

(Per thousand)

Age at Marriage	All Married Women (First Marriage)	Married Once Only		Married More Than Once	
		All	Enumerated with their Husbands	First Marriage	Current Marriage
All Ages	1,000	1,000	1,000	1,000	1,000
Under 20	157	151	147	290	2
20 - 24	538	537	538	554	83
25 - 29	226	230	232	133	283
30 - 34	56	57	58	20	281
35 - 39	17	18	18	3	204
40 - 44	5	6	6	0	112
45 - 49	1	1	1	0	35

To set the figures about women's marriage ages in perspective Table 2.13 gives, for once-married women enumerated with their husbands, their distribution within each marriage age group of wife by the difference between husband's and wife's age. The figures form a kind of counterpart to Table 2.2. They show again that, for all ages of wife combined, about 80 per cent of husbands are within a ten year age range centred at a slightly older age than that of their wives. But the concentration in this range is less for those married at older ages than for those married before they were 30. (The proportional distribution by wife's marriage age within each age difference group is shown in Table 3.1 on p.xlvi.)

Table 2.13. - Distribution of Women Married Once Only and Enumerated with their Husbands by Age at Marriage and Difference between Husband's and Wife's Age

(Per thousand)

Wife's Age at Marriage	Husband's Age in relation to Wife's Age							
	All Ages	13 or more years less	8 to 12 years less	3 to 7 years less	2 years less to 2 years more	3 to 7 years more	8 to 12 years more	13 or more years more
All Ages	1,000	0	4	53	475	354	83	31
Under 20	1,000			2†	306	538	124	30
20 - 24	1,000		0	17	506	376	77	24

40 - 44	1,000	27	63	149	261	204	130	166
45 - 49	1,000	21	54	137	245	197	155	191

† Probably inflated by errors in replies to the census questions or in processing.

Table 2.14 gives the proportional distributions by duration of marriage corresponding to those by marriage age in Table 2.12. Both all women considered together and the once-married have an even distribution of about 4-5 per cent per year of duration. (Some, though not all, of the decline at the longest durations is due to the exclusion of women over age 50 at census, and so is the increase in the proportions shown at marriage ages 35 and over.) The remarried, on the other hand, are much more concentrated: at longer periods after their first marriage, and at shorter durations of their current marriage.

Table 2.14. - Distribution of Married Women in Marriage Age Groups by Duration of Marriage

(Per thousand)

Age at Marriage	Marriage Duration (completed years)

10 and over	20	32	13					

When the women are classified in this way the comparison of the figures in each section of the table with each other is more straightforward than where they are classified by census age as in Table 2.5. Both for all durations combined and within each duration group the proportion of women with relatively many children is larger, and the proportion childless smaller, the younger the marriage age. The same is true, of course, the longer the marriage duration.

Thus the proportion with three or more children is, for all durations combined, over a third among women first married before they were twenty, under a quarter among those married at 20-24, 9 per cent for marriage age 30-34 and 2 per cent for marriage age 40-44. The corresponding proportions at duration 4 are 12, 7, 5 and 2 per cent, and at duration 15-19 they are 55, 35, 13 and presumably 2 per cent (marriage age group 40-44 is not available at this duration, since these women would have been over 50 years old at census). Table 2.16 shows very similar figures for the four fifths sample of women* of completed fertility, derived from Table C.1. The proportion of women with 3 or more children was 29 per cent for all marriage ages combined, and 60, 37, 12 and 2 per cent, respectively, for marriage ages under 20, 20-24, 30-34 and 40-44.

Table 2.16. - Distribution of Women Aged 45-49 at Census (Married Once Only and Enumerated with their Husbands) by Size of Family (Marriage Age Groups)
(Per thousand)

Size of Family	Age at Marriage							
	All Ages	Under 20	20-24	25-29	30-34	35-39	40-44	45-49
All Sizes	1,000	1,000	1,000	1,000	1,000	1,000	1,000	1,000
0	205	44	108	215	372	594	831	935
1	264	141	251	319	314	268	119	41
2	241	215	271	262	197	105	30	11
3	130	180	161	115	75	26	9	8
4	67	133	88	47	26	6	5	2
5 - 6	58	157	77	31	13	1	4	2
7 - 9	27	94	35	10	3	0	2	0
10 and over	8	36	9	1	0	0	0	1

The corresponding mean family sizes from Table A.8 are brought together in Table 2.17. It shows the same rise, for all ages combined, with advancing durations as Table 2.6. With rising marriage age the mean family size falls: it was 1.68 for all ages combined, 2.28 for those married under age 20 and 0.24 for those married at 40-44. For women of completed fertility* Table C.1 shows a mean family size of 2.01 for all marriage ages combined, 3.63 for marriage age under 20 and 0.27 for marriage age 40-44. Similarly within each marriage age group family size rises with duration, and within each duration it falls with marriage age.

* Married once only and enumerated with their husbands.

+ This gradient is characteristic of those born in the same period (1901-06), but is somewhat steeper than that for those married in any period of similar length since 1920, or for those born more recently. (See Chapter 4 and Tables D.)

Table 2.17. - Mean Family Size of All Married Women by Marriage Age and Duration

Note:- In the case of women married more than once marriage duration in this table means time since *first* marriage.

Age at First Marriage	Duration of Marriage (completed years)														
	All Durations	0	1	2	3	4	5	6	7	8	9	10-14	15-19	20-24	25 and over

45 - 49	0.19	0.13	0.16	0.30	0.27	0.11*									

Table 2.18 shows the corresponding proportions infertile, also brought together from Table A.8; their movements are the converse of those of family size. For women of completed fertility Table C.1 shows a mean proportion childless of 20 per cent, rising from 4 per cent for marriage age under 20 to 93 per cent for marriage age 45-49.

Table 2.18. - Proportion Infertile among All Married Women by Marriage Age and Duration

Note:- In the case of women married more than once marriage duration in this table means time since *first* marriage.

Age at First Marriage	Duration of Marriage (completed years)

(c) *Current Fertility*.— The fertility rates from Table A.8 are brought together in Table 2.19. They relate again to all married women, classified by first marriage. The rates for the same women classified by *current* marriage are given in Table 2.20, which makes it possible to compare these data with corresponding rates derived from registration statistics, shown in Table 2.21. The comparison is not quite exact, because Table 2.21 relates to births occurring in the calendar year 1951 instead of the year to 8th April, 1951, and because the registration data had to be converted to a marriage duration basis similar to that of Table 2.20 by estimation. It will be seen, however, that the differences are, on the whole, very small. Part of them (usually less than half the amount*) is explained by the difference in date. Those which are appreciable in absolute size occur in the first two durations, where they are of opposite sign except at marriage age under 20; the estimation for Table 2.21 may be more at fault there than the census data. The large relative differences are all at the bottom margin (old marriage ages and mostly long durations), where the numbers of births are very small, and little significance need be attached to them. Rates based on small numbers should, of course, always be used with caution.

* But including the whole of the difference in the overall rate.

Table 2.19. - Fertility Rates of All Married Women by Marriage Age and Duration

Note:- In the case of women married more than once marriage duration in this table means time since first marriage.

40 - 44	0.015	0.017	0.041	0.022	0.010	0.005	0.003	0.002	0.000						

The fertility rates in Table 2.19 again show the typical pattern: they are highest at young marriage ages and short durations, and decline with increasing marriage age and with each year of duration after the first. Both declines (by age for all durations combined and by durations for all ages combined) would be slightly steeper but for the exclusion of women over age 50 at census. The overall rate is again 0.089; for all ages the rate is 0.312 at duration 1 year, 0.158 at duration 5, and 0.025 at duration 15-19; for all durations it declines from 0.129 in the marriage age group under 20 to 0.091 at 20-24, 0.059 at 30-34 and 0.017 at 40-44. Within the marriage age group 20-24, which contains about half

the women, the general level of rates and their change with marriage duration is very similar to the all ages average.

Table 2.22 shows the proportional distribution of maternities in the year to census date by birth order. A little over a third of the total were first births, another third second births, a sixth third births and a seventh fourth and later births. This is also true of marriage age group 20-24; women married under age 20 had, in proportion, slightly more higher order births, and those married at older ages progressively fewer. The proportion of higher order births naturally rises with duration of marriage: at duration 1 year 90 per cent of the maternities relate to first births, 9 per cent to second and 1 per cent to later births, compared with 25, 51 and 24 per cent, respectively, at duration 4, and 3, 13 and 84 per cent at duration 15-19. The progression is steeper in the younger marriage age groups than in the older ones.

(d) *Women Married Once Only or More than Once, and those Enumerated with their Husbands.*— Table A.9 analyses the fertility of women married once only, and Table A.12 that of those among them (92 per cent) who were enumerated with their husbands. Tables A.10 and 11 deal with that of the remarried, the former by current and the latter by first marriage. In the case of the remarried the imperfections of the adjustments for under-statement, made primarily to correct the tables of the once-married, cannot be ignored. Tables A.15 and 16 therefore give, in abridged form, the unadjusted data corresponding to A.10 and 11. The mean family sizes, fertility rates and proportions infertile in Tables A.15 and 16 should be used in preference to those in Tables A.10 and 11. The figures for women of completed fertility in Table C.1 correspond to those for women of all census ages under 50 in Table A.12.

The relative distributions of these women by marriage age and duration have already been discussed at (a) above (Tables 2.12 and 2.14). Their distributions by size of family are compared in Tables 2.23 and 2.24. The first gives the proportion of women with more than two children in each marriage age group for all durations combined and at durations 5 and 10-14 years, and the second gives ratios of these proportions for the once-married and remarried to those for all women and of those for the once-married enumerated with their husbands to those for all once-married women. These ratios show once more the close similarity of the once-married, and of those among them enumerated with their husbands, to all women, due to their forming the overwhelming majority. Among the remarried the proportion of women with two or more children is 30 per cent larger than among all women for all ages and durations combined. But when they are analysed by first marriage this excess is seen to be due to their concentration at relatively younger marriage ages and longer durations; within age duration cells their proportions with this family size are considerably below those for all women. Analysed by current marriage, however, they are generally above, and very much so at the older marriage ages, owing to inclusion among their families of children of earlier marriages.

Table 2.22. - Distribution of All Married Women Bearing a Child in the Year to 8th April, 1951, by Birth Order (Marriage Age and Duration Groups)

Note:- In the case of women married more than once, marriage duration in this table means time since *first* marriage.

The same picture is presented by the ratios of mean family sizes shown in Tables A.13-16 and summarised in Table 2.25. The excess of 18 per cent in the mean family size of the remarried is reduced to a deficiency of 5 per cent when account is taken of their different distribution by age at, and time since, first marriage, but increased to an excess of 51 per cent when the ratios are standardised for age at, and duration of, current marriage.*

* The ratio 109 (per cent) in Table A.14, mean family size, marriage age 40-49, duration 0, is inflated by rounding errors in the process of adjusting for understatement of remarriage. The true ratio may be about 100.

The standardised ratios in this volume were calculated as follows: The numbers of women in the population serving as standard of comparison, classified in detail (e.g. by age, duration or both), were multiplied by the corresponding mean family sizes (fertility rates, proportions infertile) of the population to be compared, and the products summed. This gave the number of events which would be expected in the standard population if it had been subject to the rates of the population to be compared. Dividing by the total number of women in the standard population gave the standardised rate (mean family size, etc.), and the ratio of that to the actual rate in the standard population formed the standardised ratio. In practice it was sufficient to divide the expected number of events by the actual number in the standard population, except where the population to be compared had no rates in some of the cells (see p.xlv below).

The proportions infertile form the converse pattern to that of the mean family sizes. The once-married and those of them enumerated with their husbands have very similar proportions to all women. The proportion among all the remarried taken together is 18 per cent less than among all women, but 14 per cent more when standardised for age at, and time since, first marriage, and 55 per cent less when standardised for age at, and duration of, current marriage.

The fertility rates of the once-married are again almost identical with those of all women. The small differences occur mostly at durations 10-19, where the remarried (classified by first marriage) are relatively numerous and also have much higher fertility rates. It may seem curious at first sight that once-married women enumerated with their husbands should have a slightly lower current fertility than all once-married women and hence, particularly, than those not so enumerated. The difference is concentrated in the first year of marriage, and part of it at least is

simply due to the fact that women who had a baby in a hospital or nursing home a few days before the census would not have returned home before being enumerated.

The crude fertility rate of the remarried for all ages and durations combined is only 4 per cent below that of all women. But this average conceals a good deal of variation between different marriage age or duration groups. The high rates at 10 or more years after the date of first marriage have already been mentioned; they correspond, of course, to the early years of the current marriage, where they are, except at duration 0*, lower than the general average. Standardised for age at, and time since, first marriage the overall fertility rate of the remarried is about a third higher than the average; standardised by age at, and duration of, current marriage it is 5 per cent higher (compared with 4 per cent lower for the crude rate), i.e. the effect on the crude rate of concentration at the higher marriage ages slightly outweighs that of concentration at relatively short durations.

† Based on unadjusted data.

The proportions of first, second and later births in the year before the census by mother's marriage age are given in Table 2.26, and comparative ratios in Table 2.27. The figures in both tables relate to all durations combined and have not been standardised. The only notable differentials are again those of the remarried, who had considerably smaller proportions of first births and larger proportions of third and later births. This would be expected from the fact that they are concentrated at longer periods after their first marriage. In Table 2.26 the section for the remarried by age at current marriage, alone among the five, shows the high birth order proportions rising instead of falling with increasing marriage age, no doubt because the latter is positively correlated with the length of time for which the first marriage lasted.

* For the individual marriage age groups.

CHAPTER 3: THE FERTILITY OF SECTIONS OF THE POPULATION AS RECORDED IN 1951

1. Introduction

The fertility of different sections of the population is analysed in Tables B and C. These tables are confined to women married once only and enumerated with their husbands (the one exception is Table B.6, for gainfully occupied women married once only whether or not enumerated with their husbands). This enables them to be classified by characteristics of their husbands such as socio-economic group. Their fertility was shown in Chapter 2 to be very similar to that of all married women taken together, since they form the great majority of the latter group.

The tables in Section B, like most of those in Section A, relate to a one fifth sample of married women under age 50 at census; Table A.12 gives their total for England and Wales as a whole. Those in Section C, on the other hand, relate to a four fifths sample of women aged 45-49 at census, whose fertility was therefore practically completed. Their total for England and Wales is given in Table C.1. The figures in Tables C correspond to those at long durations for the same marriage ages in Tables A and B. Since they relate to completed fertility they provide a comparison between different social classes and the like which is somewhat more meaningful, or at any rate easier to interpret, than that of Tables B. But the latter add valuable detail to the picture and, in particular, allow a comparison of *current* fertility (annual fertility rates) which is probably better than that obtainable in other ways.

In these tables the number of women in each sample has been subdivided into many more cells than in most of the tables in Section A, and the numbers in the major groups within each table are very unequal. There are therefore bound to be many cells with very small numbers. There are certainly not enough of these to deprive the tables of their value, but where they occur the figures must be interpreted with caution. To this end the rates and ratios based on them have been printed with the significance indications shown on p.x.

Valid comparison between the statistics of different groups must take account of their different composition. The ratios of the mean family sizes of the remarried to those of all women, for instance, discussed in Chapter 2, were therefore standardised in turn for marriage age, for marriage duration and for both factors. The same procedure was used in Sections B and C, using the direct method as before. But where socio-economic groups have been cross-classified with urban/rural aggregates, industry groups or terminal education ages the procedure was extended: the ratios of, e.g., mean family size for all ages and durations combined, in the different urban/rural aggregates, were standardised for socio-economic group as well as for marriage age and duration, and vice versa.

For example, the ratio of mean family size (all ages and durations) in urban areas with population under 50,000 to that of England and Wales was standardised for socio-economic group as follows: the numbers of women in England and Wales as a whole classified by socio-economic group, marriage age and duration (from Table B.3) were multiplied, separately in each cell, by the mean family sizes in the corresponding cells for urban areas with population under 50,000 (Table B.4). The products were summed, to give the total children to be expected in England and Wales with the mean family sizes of those small urban areas. Dividing by the total number of women in England and Wales included in Table B.3 gave the standardised mean family size, and the ratio of this to the actual mean family size for England and Wales gave the standardised ratio.

In practice the standardised ratio could be calculated directly by dividing the expected number of children, calculated as described, by the actual number (aggregated from Table B.3), unless there were cells in the table

for the group to be compared which had no women. In such cases there were, of course, no mean family sizes (fertility rates, proportions infertile) either, and the women in the corresponding cells of the standard population had likewise to be excluded from the denominator of the standardised mean family size. The comparative ratios, computed by dividing this mean family size by the actual one in the complete standard population, can be only partially standardised in such cases. This happened particularly in the standardisation of socio-economic groups for industry group. But comparatively few of the ratios are much affected, and these have been specially noted in the tables.

2. Differences between the Ages of Husband and Wife

Table B.5 analyses fertility by the difference between the ages of husband and wife. The distribution of couples according to the size of this difference within each marriage age group of wife has already been given in Table 2.13 on p.xxxii. The corresponding distribution by wife's marriage age within each age difference group is shown in the second section of Table 3.1, where it may be compared with that of all women in the first section.

As would be expected wives who were older than their husbands tended to have married at an older age than those who were the younger partner. But among the latter it was those who were only a few years younger than their husbands who more often married at the youngest ages: the proportion marrying under age 25, which is 69 per cent for all women and 67 per cent for those less than three years younger or older than their husbands, is 79 per cent for those 3-7 years younger, 72 per cent for those 8-12 years younger and barely 56 per cent for those 13 or more years younger. A similar phenomenon for the younger marriage ages of *husbands* may be observed by summing the proportions in each line to the left of the diagonal step line running from between the second and third lines in the "under 20" column to between the last two lines in the "35-39" column and, in the last line, between that column and that for wife's marriage age 40-44. Beginning with the wives 13 or more years younger than their husbands and ending with those similarly older the proportions are 0, 0, 22, 67, 68, 61 and 63 per cent. Looking at it the other way around this means that the proportion of women who married a much older man was larger among those who did not find a partner while they were at the most usual marrying ages than among those who did; to a smaller extent the same was true of the men.

The bottom sections of Table B.5, as of most of Tables B and C, give comparative ratios relating the mean family sizes, proportions infertile and (where applicable) fertility rates of the various sectional populations to those of the whole population. The ratios for all ages and durations combined have been assembled in Table 3.3. The crude ratios show considerable differentials, extreme age differences (in either direction) going with lower fertility, but standardisation shows that most of this is due to the peculiar distribution of the women in these groups by marriage age and duration, especially marriage age. The standardised ratios are much more alike; they do show a slight tendency for fertility to rise as the wife's marriage age rises in relation to that of her husband.

3. Social Classes and Socio-economic Groups

Fertility differentials between the five Social Classes which have been used for many years in the publications of the General Register Office as a convenient summary are analysed in Tables B.2 and C.2, and those between thirteen Socio-economic Groups (an alternative classification introduced at the 1951 Census) in Tables B.3 and C.3.* In addition a cross-classification of other characteristics with socio-economic groups is shown in later tables. It will be discussed in later sections, and here touched on only to the extent that it affects comparability between different socio-economic groups as a whole.

* For the constitution of the social classes and socio-economic groups see Note 11 on p.xiv.

† This group has no women in age-duration cells which in Table A.12 contain between them more than 20 per cent of all women.

The marriage age distributions of the women whose husbands were in the different classes and groups are shown in the third and fourth sections of Table 3.1 and the second and third sections of Table 3.2. Table 3.1 relates to all women under age 50 at census and Table 3.2 to those aged 45-49. The latter shows a somewhat older set of distributions, since it covers practically the whole marriage experience of a single generation group (women born in 1901-06), while Table 3.1 includes the later generations who at census date had not yet reached the older ages. Hence the differentials between classes and groups are similar in kind between the two tables, but a little more extreme in Table 3.2. (For all groups the proportions married at young ages are increased by the inclusion of the younger generations in Table 3.1. But for the groups marrying relatively late in life they are increased most, since it is for these that the (older) marriages which had not yet occurred by census date form the largest proportion of the eventual total.) The outstanding exception to this similarity are the wives of other ranks in the armed forces (Socio-economic Group 13), who have the youngest marriage age distribution in Table 3.1, but one of the oldest in Table 3.2. The reason is, of course, that only a small proportion of other ranks remain in the forces until their wives are over 45, so that those included in Table C.3 (and hence 3.2) are a

selected group not representative of those who were their contemporaries at short marriage durations.*

Otherwise the distributions show the familiar type of social gradient, with the proportions marrying under age 25 lowest among the wives of professional, administrative, managerial and clerical workers and highest among semi-skilled and unskilled manual workers outside agriculture.

Tables 3.4 and 3.5 bring together the comparative fertility ratios for all ages and durations combined from Tables B.2 and 3 and C.2 and 3. They show the same kind of social gradient as was found in 1911 and 1946, though differences in classification prevent any exact or detailed measurement of changes between the three census dates. The 1911 Census records showed that the relative fertility differences between broad social groups increased during the second half of the nineteenth century. According to the Family Census data they then remained fairly stable for several decades, with some indication of narrowing for couples married in the nineteen thirties.

* It should be noted that in Socio-economic Group 13, unlike other groups, women enumerated with their husbands are not representative of *all* wives in the group and are only about half the total.

* This ratio has only a limited meaning. In its computation, cells of the "All Socio-economic Groups" section of Table C.6 containing nearly a fifth of all women had to be omitted, there being no corresponding figure in that table for Socio-economic Group 1. There are, of course, relatively few farmers outside Industry Group A.
† Socio-economic Group 13 only occurs in Industry Group N.

Among women of completed fertility enumerated in 1951 family size declined regularly from Class V (unskilled workers) to Class I (professional, etc., occupations). Part of the decline, though not a large one, was associated with the different distribution of marriage ages in the different classes. The proportions infertile showed the converse pattern. If women under age 45 at census are included (Section (a) of Table 3.4) the picture is similar; but the range of variation is smaller, because low fertility groups, whose effective childbearing period is shorter, differ from the others least in the earlier years of married life. In addition Class I appears as relatively more fertile in this section of the table; this is particularly evident for current fertility which is at least equal to the mean for all groups combined. It is possible that family size in this class, probably the class which started the historic decline, has begun to rise in relation to the general average - there are some indications of such a change in the Family Census statistics - and indeed there are signs in the fertility rate tables of a general reduction of differentials, though less so in other classes. But the fertility rates of a single year may be very misleading, as will be further explained in the next chapter, and conclusions about the trend must await future records.

The classification into socio-economic groups presents the same picture in greater detail. The groups with the largest mean family size and smallest proportion infertile are the manual workers, particularly the unskilled and semi-skilled, members of the armed forces (other ranks) - at least when allowance is made for their concentration at short marriage durations - and farmers and agricultural workers. At the other end of the scale are the clerical workers, managerial and professional workers (the lower grades being slightly less fertile than the higher), traders and shop assistants. The pattern of differential fertility rates, allowing for differences in marriage age and duration distribution, is also very similar, but once more their sums have a smaller dispersion than that of the mean family sizes in Table C.3, and the managerial and professional groups, especially the higher grades, appear more fertile on this criterion.

Standardisation for place of enumeration (in relation to the degree of urbanisation) makes very little difference, except to the agricultural workers for whom such an adjustment is of doubtful significance. Surprisingly enough the same is true of the age up to which the husbands of these women receive full-time education; the one notable exception is Group 13 (other ranks in the armed forces). It is the same with standardisation for industry - the only groups affected are those where the adjustment is of doubtful application, such as farmers and traders.

4. Regions and Urban/Rural Aggregates

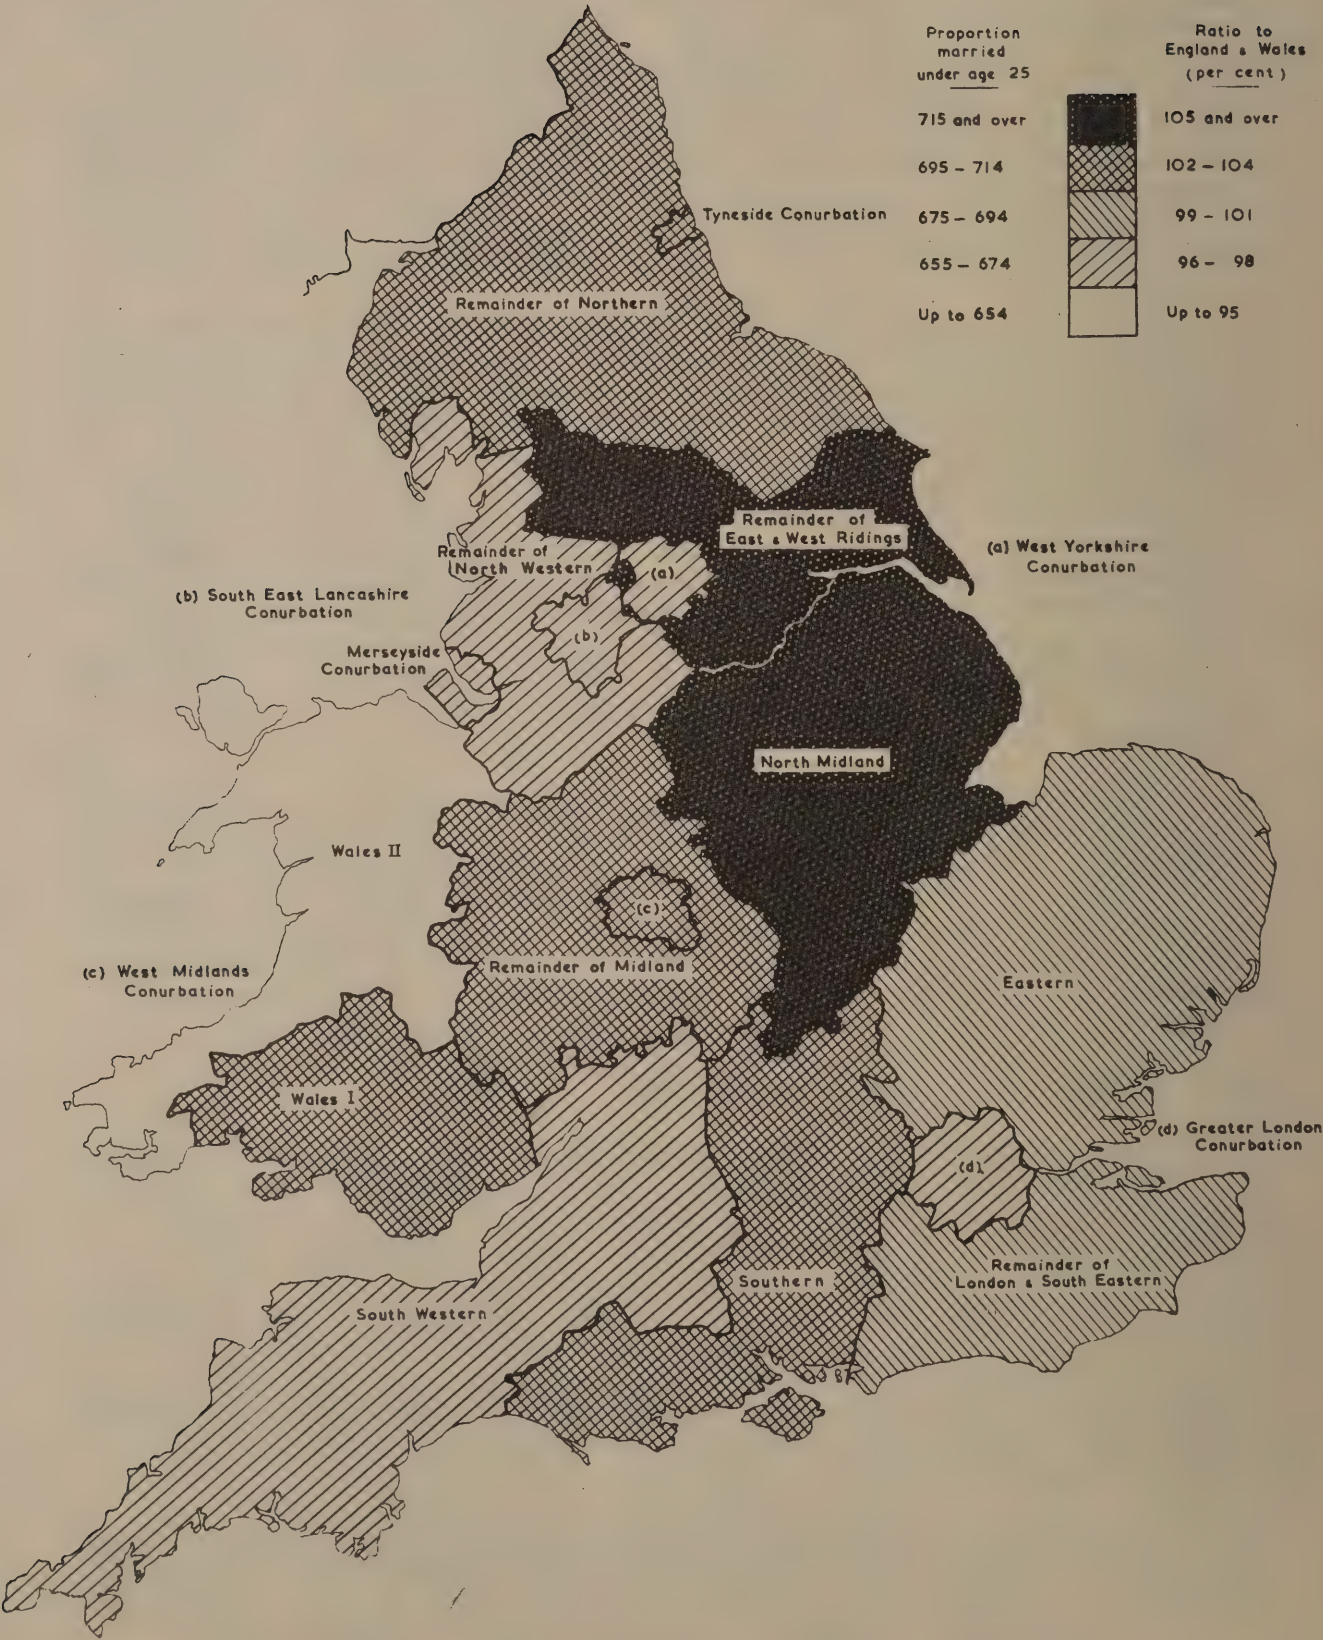

Fertility differences between the various parts of England and Wales can be studied with the help of Table B.1. In addition to Wales entire and the nine Standard Regions of England it gives figures for the six major conurbations, the remainders of the English regions and the two regions of Wales, making 17 mutually exclusive areas in all. The remaining sections of the table relate to the five aggregates of administrative areas roughly according to degree of urbanisation.* The latter are cross-classified by socio-economic group in Table B.4. Table C.4 gives corresponding figures for women of completed fertility enumerated in these urban and rural aggregates, both as a whole and cross-classified by socio-economic group.

The marriage age distributions of the various areas are given in the fifth and sixth sections of Table 3.1 and the fourth section of Table 3.2. Diagram 3.1 summarises the proportions married under age 25 in conurbations and remainders of regions. They are high in a central belt

* For the constitution of all these units see Explanatory Notes on p.viii.

Diagram 3.1. - Proportions Married under Age 25
per thousand Married Women under
Age 50 at Census

Conurbations and
Remainders of
Regions

stretching from the Northern to the Southern Region with an extension into South Wales, the Remainder of the East and West Ridings and the North Midland Region having the highest. The proportions are lower on either side, being lowest in Wales II (North and Central Wales), followed by the entire North Western Region including its conurbations and the neighbouring West Yorkshire conurbation as well as Greater London and then the South West. But most of the differences are moderate in size. Between urban and rural aggregates they are smaller still. Outside the conurbations the proportion marrying under age 25 is lowest in the rural districts and rises with increasing degree of urbanisation, but the conurbations depart from this pattern and come between the rural districts and the smallest urban areas.

Table 3.6 gives the comparative fertility ratios for women under age 50 (all marriage ages and durations) in the various regional divisions. Those relating to mean family size (unstandardised) are illustrated in Diagram 3.2.

Far and away the highest fertility is found on Merseyside, the next highest in the Northern Region, especially outside Tyneside, and Wales II. At the other end of the scale comes Greater London, followed by the two neighbouring conurbations of West Yorkshire and South East Lancashire. Only a small part of these contrasts is explained by differences in marriage age and still less by those in duration. The Remainder of the East and West Ridings is among the areas whose (comparatively high) ratio is reduced by standardisation. In the case of the two Welsh regions standardisation actually makes them more different, increasing the ratio for Wales II and reducing that for Wales I. The fertility of Wales entire is clearly greater than that of England.

The ratios of proportions infertile and fertility rates present a similar picture, except that standardisation makes a little more difference and helps to explain some apparent anomalies. Thus the relatively high fertility rate in the Southern Region, which contrasts with its normal mean family size and proportion infertile, is largely due to the distribution of the women concerned, particularly by marriage duration. A relatively old marriage age distribution accounts for differences in the three ratios for Wales II.

The ratios for urban and rural aggregates are summarised in Table 3.7, and show the highest fertility in rural districts and the lowest in the conurbations and the towns with between 50,000 and 100,000 inhabitants. Except for the rural districts the differentials are small. They are little affected by standardisation, except that the larger mean family size of the rural population is not unnaturally associated with its different socio-economic structure.

The results of the detailed cross-classification, some of which are summarised in Tables 3.11 and 3.12, have to be interpreted with some care. Thus the urban-rural differential of mean family size is clearly greater for the two agricultural groups, especially Group 2 (agricultural workers other than farmers and the like), but the lower figures in all the urban aggregates clearly relate to different people - Group 2 in these areas, for example, will contain a much greater proportion of gardeners and relatively fewer farm labourers. It is not unlikely that the curious gradient in Group 12 (unskilled workers) is due to a similar heterogeneity in this large group; their mean family size, exceptionally, rises with increasing degree of urbanisation, and for women of completed fertility in rural districts is no greater than that of Group 11 (semi-skilled workers). In Group 13 (armed forces) the numbers are so small that the departure of the differentials from the national pattern could easily be due to chance. The same qualifications apply to the socio-economic group differentials within each urban or rural aggregate.

The first section of Table 3.12 shows, however, that the mean family sizes in the (cross-classified) cells forming the body of Table 3.11 do not differ very much from those which would be expected from those for area aggregates and socio-economic groups entire shown in the margins. Nevertheless it is clear that mean family size varied much more consistently with socio-economic group than with urban/rural aggregate.

5. Education

The census schedule asked for the age at which people ceased to receive full-time education at an educational establishment. The question was not primarily intended for fertility analysis, and was therefore confined to gainfully occupied persons (and those seeking gainful employment) in order to lighten the burden of response on the public. It was therefore not possible to analyse fertility by the wife's educational level or by the difference in this level between husband and wife, but an analysis by the husband's terminal education age could be made and was combined with his socio-economic group as well as with the mother's marriage age. The figures, which relate to women of completed fertility, are presented in Table C.5. The proportions married at different ages for different terminal education ages are given in the fifth section of Table 3.2 and comparative fertility ratios which relate to all marriage ages combined are given in Table 3.8.*

* Ratios for Socio-economic Groups standardised for terminal education age are given in Table 3.5 (see pp. 1 and 11 above).

Table 3.8. - Ratios of Mean Family Sizes and Proportions Infertile to those of All Women Married Once Only and Enumerated with their Husbands

Terminal Education Age

Women aged 45-49 at Census. All marriage ages combined.
(Per cent)

Terminal Education Age	Mean Family Size			Proportion Infertile		
	Unstand- ardised	Standardised for Marriage		Unstand- ardised	Standardised for Marriage	
		Age	Age and Socio- economic Group		Age	Age and Socio- economic Group
Under 15	105	103	101	93	97	98
15-16	74	80	88	124	110	107
17-19	72	81	88	134	110	111
20 and over	79	87	89	119	100	113

Marriage age varies clearly and directly with terminal education age. The widest gap is between the great majority of women aged 45-49 at census whose husbands left school before they were 15 and the next group (school leaving age 15 or 16): 56 per cent of the former married under age 25 compared with 39 per cent of the latter and 30 per cent of those whose husbands' full-time education lasted until after their twentieth birthday.

This difference in marriage age helps to account for the differences in fertility, and the distribution of these couples by socio-economic group as well as marriage age accounts for a little more still. But standardisation for these factors does not remove the basic pattern: those who had some further education after the compulsory school age tended to have the smallest families, and the families of men with late terminal education ages came in size between theirs and those of people with no further education after the compulsory school leaving age.*

The detailed sections of Table C.5 show that in Socio-economic Group 3 (higher professional, administrative and managerial occupations) the mean family size of those whose full-time education lasted until after their twentieth birthday was in fact the greatest. In several other groups, however, notably 5 (traders), 6 (clerical workers) and 10 (skilled manual workers), theirs was the smallest family size.

These are all among the groups whose fertility differentials according to education differed appreciably from those which would have occurred if each socio-economic group had had the national differentials according to education and each education group the national differentials according to socio-economic group, each having been standardised for the other but not for marriage age (Table 3.12). Actual mean family size was higher than this "expected" level for terminal education ages 15 and over in Socio-economic Groups 1 (farmers) and 3 to 6 (professional, managerial and clerical workers, including traders), particularly 3 (higher professional and managerial workers), and lower in Groups 2 (agricultural workers) and 11 (semi-skilled manual workers). By the same token the socio-economic group differentials within terminal education age groups other than Under 15 differed from the national differentials, which is not surprising considering how the latter are dominated by the Under 15 group.

By and large, mean family size varied slightly more consistently with terminal education age than with socio-economic group.

* Most of the men concerned would have left school before or during the first world war.

6. Industry

In Table C.6 fertility data are presented for the wives of men engaged in 13 broad groups of industries, cross-classified by socio-economic group.

The last section of Table 3.2 gives their proportional distribution by marriage age, and shows that by a clear margin the largest proportions marrying young were in the mining and quarrying group, where nearly two thirds of the women had married before they were twentyfive. Next came those in metal manufacturing, transport and fishing, and building and contracting. At the other end of the scale far and away the oldest marriage age distribution occurred in the professional services group, with less than two fifths marrying under age 25, followed by agriculture and forestry, distributive trades, and other services (barely half).

The mean family sizes and proportions infertile of the various groups are compared in Table 3.9, which again brings together from the bottom sections of Table C.6 those comparative ratios which relate to all marriage ages combined. Easily the highest fertility, as measured by the unstandardised ratios, was that of the mining and quarrying group; a large part of its lead was associated with this group's tendency to marry young which has already been noted. Other high fertility groups are building and contracting, metal manufacture, and agriculture and forestry. Relatively low fertility was found in the professional services, clothing, textiles, distributive trades, and other services groups, the first of these being again affected by its tendency to late marriage. Standardising for marriage age or for socio-economic group as well as marriage age reduces the differences between the groups and alters their order somewhat, but generally without disturbing the broad division into groups of relatively high, medium and low fertility. Those most affected are, at the top end, the mining and quarrying group and metal manufacture, and at the bottom end the professional services group and the distributive trades.

Table 3.9. - Ratios of Mean Family Sizes and Proportions Infertile to those of All Women Married Once Only and Enumerated with their Husbands } Industry Groups

Women aged 45-49 at Census. All Marriage ages combined.
(Per cent)

Industry Group	Mean Family Size			Proportion Infertile

H. Other manufacturing industries and gas, electricity and water	100	99	97	98	100	101
J. Building and contracting	117	114	112	85	89	92
K. Transport and fishing	106	103	100	89	95	98
L. Distributive trades	85	88	98	113	110	105
M. Professional services	82	90	95	120	103	101
N. Other services	91	93	98	111	107	105

The cross-classified tables summarised in Tables 3.11 and 3.12 show that, on the whole, fertility varied more consistently with socio-economic group than with industry group. Many of the apparent exceptions were due to small numbers giving rise to chance fluctuations. Differences between the national fertility differentials by industry and those within a particular socio-economic group were most noticeable in Group 3 (higher administrative, professional and managerial occupations), and to a lesser extent in Groups 4 (other administrative, professional and managerial), 5 (traders) and B (personal service). Within the industry groups exceptions to the national socio-economic group pattern occurred particularly in Groups B (mining and quarrying), F (clothing) and M (professional services). The high fertility of the mining group as a whole was evidently due to the exceptionally large families of those actually occupied as miners, while the unskilled workers attached to the industry (mostly labourers attached to such activities as bricklaying and the production of chemicals, metal and engineering products and cement) had slightly smaller families than the average of Group 12. In the professional service group (M) the professional men (Socio-economic Group 3) had families a fifth larger than would be expected from the national differentials of Groups M and 3.*

7. Occupied Married Women

The tables discussed so far have analysed the fertility of married women by the occupation or industry of their husbands. Table B.6 relates to women who were gainfully occupied themselves. The 20 per cent sample of married women under age 50 at census contained about 360,000 such women.

Table 3.10. - Ratios of Mean Family Sizes, Proportions Infertile and Fertility Rates to those of All Women Married Once Only

Occupied Married Women†

Women aged under 50 at Census. All marriage ages and durations combined.
(Per cent)

	Unstandardised	Standardised for -		
		Age	Duration	Age and Duration
Mean Family Size	69	69	73	72
Proportion Infertile	191	190	173	172
Fertility Rate	18	18	17	17

† Married once only; whether or not enumerated with their husbands.

Their distribution by age at marriage, shown in the last section of Table 3.1, was very similar to that of all once-married women, with 70 per cent married under the age of 25. Table 3.13 shows their distribution by marriage duration, which was very different from the general pattern (given in Table 2.14). The proportions at the beginning of married life were much higher, then declined rapidly and rose to a level similar to that for all once-married women after 10 years of marriage. They reflect the fact that many women continue to work outside the home for a while immediately after marriage and leave paid employment when their children are born, some of them returning when the children are of school age.

* These comparisons of actual and expected fertility differentials have been made without standardising for marriage age. In the present context it seemed best to regard marriage age distribution as part of the reproductive behaviour of the different groups - a characteristic part with an influence on their relative fertility, but not one to be removed from the comparison in the first instance.

Table 3.11. - Mean Family Sizes cross-classified by Socio-economic Group and Other Types of Comparison

Women aged 45-49 at Census. All marriage ages combined.

Note:- The standardised mean family sizes in this table have been computed as the means of those in the line or column concerned weighted by the distribution of women in that column or line for all groups combined.

	K. Transport and fishing	+14*	-16*	0	+8	+11	-6	-6	+8	0	0	-7	+1	
	L. Distributive trades	-24*	+24	-2	-5	-2	+2	+5	-6	-5	0	-1	+4	
	M. Professional services	+9*	-4	+21	+5	+4*	-5	+2	+10	-10	-6	+17	-6	
	N. Other services	-15	-8	+4	+2	-9	+2	+15	-2	+6	-1	0	+4	+4

This pattern is also visible in the comparative fertility ratios at the bottom of Table B.6, which show that the proportions childless were very much higher among occupied than among other married women at marriage durations 2 to 14, but less abnormal (though still higher) before and after. The mean family sizes were very low in relation to married women in general from the beginning of marriage, and began to rise towards a more normal level after 5 to 10 years of marriage.

Table 3.13. - Distribution of Occupied Married Women by Duration of Marriage

Women aged under 50 at Census, married once only. All marriage ages combined.

	Duration of Marriage (completed years)															
	All Durations	0	1	2	3	4	5	6	7	8	9	10-14	15-19	20-24	25 and over	
Per 1,000 at all durations	1,000	91	65	51	47	38	35	27	25	31	36	206	173	125	50	
Ratio to proportions for all once-married women (per cent)	100	208	145	114	95	82	77	76	77	79	81	90	102	101	98	

Nevertheless the ratios for all ages and durations combined, reproduced in Table 3.10, were very little affected by the differential duration distribution of occupied women. Their mean family size was about 70 per cent of that of all once-married women, the proportion childless a little less than double and the fertility rates (the ratios for which were naturally low throughout Table B.6) between a fifth and a sixth of the general level.

CHAPTER 4: FERTILITY BY YEAR OF MARRIAGE, 1920-1955

1. Cohort Analysis: Purpose and Sources

Put at its simplest, the question to which a fertility enquiry seeks the answer is: How many children do people have? If the answer is to be meaningful the question must be made more precise. This can be done in a number of ways, and has to be for different purposes. But the most fundamental meaning of "how many children?" is probably "how many altogether, over a person's or couple's lifetime?", that is, the ultimate family size or completed fertility.

Again, "people" must be defined, in the first place with reference to time and space, if their fertility is to be measured. The present volume relates to the population of England and Wales. As for time, the most natural way of dealing with the question of family size would be to take a group of people who are contemporaries in some sense, such as those born or married in a particular year, and to follow them through their reproductive lives. Such a group is generally called a "cohort"; in this country it is more usual to refer to those born in the same period as a generation, and to reserve the term cohort for those married in the same time interval.

The detailed records needed for following the fertility of a generation or marriage cohort throughout its lifetime exist in very few countries. But it is possible to approximate to the results of such a study statistically, using fertility data from censuses and current vital registration records (provided the latter comprise certain details). This is necessary for a proper assessment of fertility; the recognition of this fact is perhaps the greatest advance of modern demography.

By themselves, the census data obtained in 1951 constitute a valuable "snapshot" of the position reached at that date by many different cohorts or generations, all at different stages of their development; they give information about differentials between social groups and provide a benchmark for the study of cohorts over time, but they are no substitute for it. The information about family size relates to census date, and is therefore not comparable for different marriage cohorts unless their fertility was already complete; as the questions were confined to women under the age of 50 this means that a study of family size over time needs the linking of the data with earlier material, principally that of the sample Family Census of 1946.

Analysis of the births of any one period such as a year can give misleading results when either family size or the timing of births are changing. The violent fluctuations in the fertility rates of the last twenty years are an indication of this. But the annual records (with the details which are prescribed in this country) are essential for bridging the gap between censuses, and for continuing the build-up of the reproductive histories of different cohorts or generations from the benchmark provided by the latest census.

There have been great changes in family size over the last hundred years in all the countries of Western civilisation. The spread of family limitation has led to a continuous reduction in the number of children per couple. More recently there have been indications of a change in trend, the first for at least two generations. But the upheavals of economic depression and recovery and particularly of the second world war and its aftermath have so distorted the annual numbers of births that only the study of the sequence of cohorts can lead to a proper appreciation of what has happened. The war has now been left behind just long enough for the current trend to become clearly visible in data linked together in this form.

Such an integrated series of records makes it possible to study, in addition to ultimate family size, a matter of more detailed interest which has already been mentioned - the time pattern of family building. Both

can be further analysed by such factors as age at marriage. By this kind of analysis the significance of data for cohorts whose fertility is not yet complete can also be assessed much better than by older methods, and a beginning made with the measurement of current family building habits and of the degree to which the population is replacing itself, free from the violent distortions to which annual rates are subject.

The sources which have been used for this purpose have already been mentioned. They are the (unpublished) material relating to England and Wales from the Family Census of 1946, the 1951 Census tabulations, and the annual vital statistics as enlarged by the Population (Statistics) Act, 1938. The data from each of these sources are not strictly comparable with each other, and considerable technical problems had to be solved in linking them. (They are described in Appendix 1 to this chapter on p.xcv.) The results are now presented in Tables D and E. They are, of course, to some extent approximate, but should be quite adequate for their purpose, and will be kept up to date each year in the Registrar General's Statistical Review.

Tables D give the mean family size of women married once only, at each duration of marriage, for marriages of each calendar year from 1920 to 1954, i.e., on the date of marriage and on each wedding anniversary up to the one occurring in 1955. The figures are given for all women married under the age of 45 combined and for each marriage age group separately.

Tables E give the corresponding fertility rates, i.e., the differences between the family sizes of Tables D, showing how the latter were built up over the period of married life.

On a later occasion it is hoped to analyse the distributions of family size as well as their means, and to calculate fertility rates by birth order.*

2. Completed Fertility

Data on completed family size by marriage cohort exist in this country for marriages from the eighteen-sixties onwards. That is just about the group with which the decline in fertility due to the spread of family limitation began. Table 4.1 and Diagram 4.1 show that the decline, once started, quickly gathered momentum and continued at a remarkably steady pace of about 2 per cent per annum for nearly fifty years, that is, until the early nineteen-twenties. The first world war superimposed an irregularity on this trend, mainly because couples married between 1915 and 1918 seem to have been unable to make up all the births postponed during the period of hostilities. In less than two generations the average size of a completed family was reduced from about six children to little more than two.

After the marriages of 1922 or 1923, however, the downward trend began to slow down. It is even possible that but for the war it would have done so ten years earlier, though too much should not be read into the few single-year figures available for that period and given in Table 4.2. Since the marriages of about 1927 there has been little change in the mean ultimate family size.

The figures in Table 4.2 for cohorts whose fertility was not yet complete by 1955 have had to be estimated by projection from the position reached in that year. This has been done by assuming that their future fertility rates will be equal to the average of the rates at corresponding

1933	110.9		
1934	112.9		

durations for the four years from mid-1951 to mid-1955. For the cohorts married in 1940 or earlier, who had been married for at least 15 years in 1955, the projected family sizes are not likely to be subject to any significant error. Even those up to 1945 (duration 10 or more in 1955) can be accepted with a certain amount of confidence, since by duration 10 the 1930 cohort, e.g., had reached nearly 80 per cent of its ultimate family size. For marriage years after 1945, however, the figures become more and more speculative. (Mean family sizes at the individual durations actually reached in years up to 1955 are shown in Diagram 4.3.)

Diagram 4.2. - Legitimate Live Births per 1,000 Married Women under Age 45
1910-1956

These data indicate clearly that the last generation has seen a change in the trend of marital fertility as complete and almost as rapid as that which occurred in the eighteen-seventies. There have been minor fluctuations, but even the fall for the marriages of 1940 has been much smaller than that which occurred after 1914, and since then mean family size has risen to the level of the cohorts of the mid-nineteen-twenties. As yet there is no indication of a continuing rising trend, but the average number of children per first marriage continuing to the end of the wife's reproductive period has now been stable in the neighbourhood of 2.1 for twenty years or more. This fact is in striking contrast to the violent fluctuations in fertility rates from year to year, shown in Table 4.3 and Diagram 4.2.

The family sizes of individual marriage age groups, shown in Diagrams 4.4 to 4.9, decline, of course, with increasing age; those of women married under 25 are above the average and those of older women below it. Their general history has been similar to that described for the average of all married women; in particular they have all shared in the ending of the downward trend.

Diagram 4.3. - Mean Family Sizes of Women Married in 1920 to 1954,

Marriage age under 20

Diagram 4.5. - Mean Family Sizes of Women Married in 1920 to 1954,
by Calendar Year of Marriage and Duration of Marriage

Marriage age 20-24

The dip in the family sizes of the cohorts married between 1939 and 1943 is much more marked for those married at ages under 20 than for the older groups; with increasing age it rapidly becomes shallower and finally disappears. It is not surprising, therefore, that a substantial part of the dip is accounted for by the reduction in those years in the number of extramarital conceptions which result in legitimate births because the parents are married before the confinement. (In the disturbed conditions of war-time many of them were born illegitimate instead - the reduction in the total number of extramaritally conceived births was rather smaller.) For the incidence of such births is highest at the youngest marriage ages, affecting about half the marriages of 1938 where the bride was under the age of 20 and about a third of the corresponding marriages of 1950-55.

This is by no means the whole explanation of the lower family sizes of these cohorts, and indeed it was to be expected that not all births postponed during the war, when couples were separated for long periods, could be made up afterwards. Rather is it notable that the making-up has been so much more complete than after the first world war. Since fertility is highest immediately after marriage the war would tend to leave its mark particularly on the family size of couples married in those years. But one would expect the effect to be most marked for the older marriage age groups, who cannot bear many children at relatively long marriage durations. Yet this is not so, partly because the effect of changes in premarital conceptions would work in the opposite direction, and partly no doubt because the husbands of older women would tend to be older themselves and therefore less likely to be separated from their wives by military service.

The under-twenty age-group differs from the others also in that over the period covered by Tables D (i.e., marriages since 1920) the decline in its ultimate family size was at first less steep. Then came the much greater decline for the war-time cohorts, and the recovery since then has been slower than the average.

Diagram 4.6. - Mean Family Sizes of Women Married in 1920 to 1954,
by Calendar Year of Marriage and Duration of Marriage

Marriage age 25-29

Diagram 4.7. - Mean Family Sizes of Women Married in 1920 to 1954,
by Calendar Year of Marriage and Duration of Marriage

Marriage age 30-34

With advancing marriage age not only is the war-time fall smaller but also the subsequent rise greater, except for the very oldest. For marriages at ages 25-39 the ultimate family sizes of the post-war cohorts will in fact be appreciably higher than those of the pre-war ones. This may have something to do with the tendency, already mentioned, for fertility in the early years of marriage to determine ultimate family size more and more as marriage age rises. But it may well derive to a considerable extent from the postponement of marriages during the war, leading to many women marrying in the immediate post-war years being included in older marriage age groups than those to which they would normally have belonged. If they carried with them to some extent the fertility habits of their normal group this would lead to a rise in the average family size of

Diagram 4.8. - Mean Family Sizes of Women Married in 1920 to 1954,
by Calendar Year of Marriage and Duration of Marriage

Marriage age 35-39

Diagram 4.9. - Mean Family Sizes of Women Married in 1920 to 1954,
by Calendar Year of Marriage and Duration of Marriage

Marriage age 40-44

particular marriage age groups, and also account for the slight tendency to subsequent decline which is suggested by some of the diagrams. Yet even this cannot be the whole story, because the figures for all ages under 45 combined (Diagrams 4.1 and 4.3) also show a rise, though little or no suggestion of a peak for the 1946-47 cohorts.

Underlying the fluctuation there has been a tendency for age at marriage to decline, and this would make for larger families. This trend began at the outbreak of war, and was in complete contrast to the experience of the present century until then.

But as we have seen it must not be taken for granted that (even on average) women who now marry at a younger age than their predecessors automatically adopt the fertility which previously characterised the younger marriage age group. This becomes clearer if we look at the course of family size differentials between marriage age groups over the last generation.

**Table 4.4. - Mean Ultimate Family Size for each Marriage
Age Group expressed as a Percentage of that
for All Marriages under Age 45**

For cohorts whose fertility was not yet completed in 1955 the ultimate family size has been projected on the assumption that fertility rates after that date at each age and duration will equal the average of the rates in the 4 years from mid-1951 to mid-1955. The proportion of the ultimate family size added in this way exceeds 10 and 20 per cent respectively for marriages in or after the following years:-

Marriage Age	10 per cent	20 per cent
All under 45	1942	1946
Under 20	1939	1943
20 - 24	1942	1946
25 - 29	1945	1948
30 - 34	1948	1950
35 - 39	1950	1952
40 - 44	1953	1954

Calendar Year of Marriage	Age at Marriage					
	Under 20	20-24	25-29	30-34	35-39	40-44
1920	155	114	83	64	37	17
1921	158	114	80	61	37	21
1922	159	115	80	63	37	16
1923	158	114	82	62	36	14
1924	163	115	79	61	35	20
1925	161	115	78	62	37	18
1926	162	116	78	56	35	17
1927	164	114	78	61	33	20
1928	167	114	79	55	32	11
1929	164	114	79	56	32	12
1930	163	113	81	56	32	13
1931	162	113	79	55	33	13
1932	164	112	79	59	32	12
1933	164	113	80	60	29	13
1934	168	113	81	56	32	18
1935	163	114	82	58	27	13
1936	165	113	83	58	33	10
1937	163	111	85	59	30	9
1938	157	110	85	60	33	10
1939	151	108	84	60	29	8
1940	145	107	85	60	31	12
1941	144	106	83	60	32	12
1942	139	105	83	59	30	11
1943	137	105	85	61	31	10
1944	137	104	85	63	32	11
1945	140	104	86	63	34	12
1946	143	107	87	63	34	12
1947	143	105	87	61	32	11
1948	145	104	86	60	32	10
1949	146	103	83	60	31	10
1950	144	102	84	64	33	10

Table 4.4 and Diagram 4.10 show that the dispersion between the ratios of the ultimate family sizes of individual marriage age groups to the mean for all women first married under the age of 45 widened somewhat during the nineteen-twenties. The lead of the under-twenty group increased, because its family size was declining less than the average, while that of the age-groups over 30 was falling more sharply. But from the middle of the nineteen-thirties, and particularly during the war, the differentials narrowed rapidly for marriage age groups under 35; only the 40-44 group continued to diverge slowly. After the war there has again been some general widening, though it is possible that it has since begun to be reversed; but the figures for these cohorts, who had been married for less than ten years in 1955, contain an appreciable speculative element and must be treated with reserve. It is safe to say that so far the differentials are still smaller than twenty-five years ago, and that this would limit the effect of younger marriage in increasing the average size of completed families.

Diagram 4.10. - Mean Ultimate Family Size for each Marriage Age Group
expressed as a Percentage of that for All Marriages under Age 45
Marriages of 1920 to 1950

3. The Time Pattern of Family Building

Tables E show the fertility rates of the different marriage cohorts in each successive year of their marriage, and these are illustrated in Diagram 4.11. They measure the successive additions by which the ultimate family size is gradually built up, the rate at which, on average, people have their children. There is the usual pattern of fertility being highest just after marriage and for women married at the youngest ages, and, broadly speaking, declining steadily with advancing duration and marriage age.

Diagram 4.11. - Fertility Rates of Women Married from 1920 onwards, by Period of Maternity and Duration of Marriage

All marriage ages under 45

These rates are, of course, much more sensitive to the impact of events in any one year than are family sizes built up over a long period. Their fluctuations around the trend are much more violent and occasionally even reverse the normal relative positions of rates at different durations.*

Over the period covered by the tables there was a general decline in fertility rates until about 1933[†], corresponding to conceptions up to about 1932, the year in which the mass unemployment of the great depression reached its peak. After that most of them became fairly stable, the chief exception being a continued fall at duration 0. The outbreak of war in 1939 brought a steep decline, specially marked at duration 0 where the rate (for all marriages under age 45 combined) fell for the first time below that for duration 1. This is undoubtedly due in part to the simultaneous fall in legitimate fertility rates relating to premarital

* It should be noted that in Tables E and Diagrams 4.12-18 the period when the children were born (the period of maternity) is constant along the diagonals running from top right to bottom left, while in Diagram 4.11 it is constant along any vertical line.

[†] Year of maternity.

conceptions. This fall in turn derives partly from the fact (already noted) that in many cases of such conceptions where the parents would normally have married before the birth of the child the call-up and generally the disturbed conditions of war-time prevented a marriage, so that the child was born illegitimate instead, and partly from the very large number of marriages contracted in 1939 and 1940 under the stimulus of war; as hardly any of the additional brides would have been pregnant at marriage they would only have added to the denominators of these rates, while the numerators were reduced by the effect of wartime separation just mentioned. Both influences were strongest at the youngest marriage ages. But it must be remembered that this merely helps to explain why the rates for the first year of marriage fell more than those for later years, and that the war for a time caused a general fall in the number of children being born.

After 1942, however, the rates began to rise again almost as rapidly as they had fallen, and continued to do so, apart from some interruption in 1945 associated with the transfer of men to the Continent in the previous year's invasion, until 1947. In that year the making-up of births postponed during the war was at its peak; it continued for several more years, with the rates gradually declining. The process was in many ways similar to that experienced in the first world war, but with the important difference that the recovery did not await the end of hostilities, but began in the depth of the war. It is true that by 1942 the worst seemed to have been averted, but only just, and danger, dislocation and discomfort were still the order of the day. Long before any peace or security was in sight (if one considers the date of conception rather than of birth) the rates were reaching peace-time levels. There were, of course, important differences between the two wars; in the second one most husbands in the forces were present in this country for a much greater part of the period of hostilities, and there were far fewer fatal casualties. On the other hand the main theatres of war were, between 1941 and 1944, much further away than in 1914-1918, and the impact on the civilian population, through bombing, evacuation and industrial work by married women, was much greater. The contrast is remarkable, and it will be referred to again.

Since 1952 fertility rates have been fairly stable, at levels appreciably above those of 1937-38 for short durations other than 0 and lower at durations 10 and over. The rate at duration 0 (all marriages under age 45) is again higher than that at duration 1, but the excess is much smaller than before the war, and the rate itself still below the pre-war level, in contrast to those at durations 1 and over. The exception is associated with the fact that the proportion of all extramarital conceptions which results in legitimate births, while higher than during the war, is still lower than before it.*

When the development of the rates for the different marriage age groups is considered, the under-twenty group stands out for the behaviour of its rate at duration 0 which is, of course, of all age rates at that duration the one most affected by premarital conceptions. In contrast to the rates at other durations (or ages) it did not decline before the war - it even rose during the nineteen-twenties - but the drop at the outbreak of war was all the greater, from 0.580 in 1938-39 to 0.280 in 1942-43 (less than half the former value). Since then it has risen again, though not to the pre-war level. This age-group also differs from the others in that the war-time trough affected durations after the first very little, though they all shared in the post-war peak.

* The total number of premaritally conceived legitimate maternities is now about three quarters of the 1938 number, but at ages under 20 they are roughly at the pre-war level. Nevertheless the corresponding *rate* is lower, because so many more women are married before they are 20. More and younger marriages have also meant that there are fewer unmarried women at older ages, with the result that, although the total number of extramarital conceptions (*including* illegitimate births) is lower than in 1938, the age-specific rates per 1,000 unmarried women and pregnant brides combined are higher.

Table 4.5. - Average Addition to Family Size, All Marriages under Age 45

Calendar Year of Marriage	Duration of Marriage (completed years)						
	Before Marriage	0-4	5-9	10-14	15-19	20-24	25-29

Diagram 4.18. - Average Addition to Family Size in Five-Year
Segments of Marriage Duration, Marriages of 1920 to 1950
Marriage age 40-44

In the marriage age group 20-24 the course of rates was more normal. As for all ages combined the rate at duration 0, previously above that at duration 1, dropped below it for the first time after the outbreak of war, but in this case it has stayed below. At marriage ages 35 and over there was only a shallow war-time trough or none at all.

Instead of considering fertility rates by date of maternity we may look at the rate of family building by marriage cohorts. In that case it is convenient to aggregate the rates for segments of marriage duration longer than a year. This has been done for five-year segments in Tables 4.5-11 and Diagrams 4.12-18. They illustrate clearly that the war disturbance affected different cohorts at different stages in their married lives, so that the troughs and peaks are staggered from right to left in the diagrams with increasing marriage duration. The same phenomenon can be seen in a different way from the varying width of the bands between individual duration lines in the family size diagrams (4.3-9). The net effect is a high degree of compensation between the different duration segments, which reflects the postponement/making-up cycle and accounts for the contrast between the great stability of mean family size and the wide fluctuations in the fertility rates that went into the making of it.

The corresponding figures for individual marriage age groups show a similar course, with the troughs and peaks getting less and less marked as marriage age rises.

If the average additions to family size in the different duration segments are expressed as a proportion of the mean ultimate family size it is found that women married in the nineteen-twenties had, on average, a little over half their children during the first five years of marriage, about a quarter in the second five and about an eighth in the third five years. The figures for later marriages are dependent on the somewhat hypothetical projection of fertility rates after 1955, but the picture they present is entirely plausible: a decline in the proportion of ultimate family size achieved in the first five years below half for the early war-time cohorts compensated by an equally temporary increase in the next five-year segment, with the post-war cohort proportions fairly steady near the pre-war level, a little higher in the first five years and a little lower in the third and later segments.

Cumulating these proportions is equivalent to taking the ratios between the mean family sizes in Tables D at every fifth duration and the mean ultimate family size for each cohort. This has been done in Table 4.12 and Diagram 4.19. They show that the proportion of mean ultimate family size achieved after ten years of marriage has been fairly stable near 80 per cent. For the cohorts 1922 to 1930 it had a very slight tendency to decline, followed by a dip caused by the war and compensated by the time duration 15 had been reached.* The proportions for later cohorts again make increasing use of projected fertility; they suggest some rise followed by stability at a level slightly higher than pre-war, but still close to 80 per cent.

* Mean ultimate family size for these cohorts was very stable.

It is evident from this discussion that in a period when the time pattern of family building is as disturbed by the stress of events such as wars and economic depressions as it has been during the last generation, the records of any short period can be a very misleading guide to the ultimate family size of the cohorts living through it.* That is why cohort analysis is so necessary. And the impact of recent events on the time pattern is still far from fully understood. The cycle of postponing and making up births is clear enough, but not the way its timing was determined. This has already been referred to, and it should be noted that the rise in fertility rates during the second half of the war, so different from the experience of 1914-1918, was shared by many other countries, including neutrals such as Sweden. The matter is complicated by the fact that the full employment brought by the war would tend to produce a making-up of births postponed during the economic depression, while at the same time other births would be postponed owing to the effects of the war itself. Whether the reason for the unexpected war-time upsurge is to be sought mainly in an uncovering of the deeper emotional needs under the stress of war, or more in the lack, in conditions of scarcity, of objects of expenditure competing with children, or even in the temporary effect of an increase in desired family size superimposed on the continuing spread or increasing effectiveness of deliberate family limitation, can

* For a fuller discussion see N.B. Ryder, *La mesure des variations de la fécondité au cours du temps*, "Population", Vol. 11, No. 1 (Jan.-March, 1956), pp. 29-46.

only be a matter for speculation.*/ In any event ultimate family size seems to have been little affected, though on balance it may have risen very slightly.

4. The Question of Replacement

Having analysed the level of fertility, it remains to discuss the degree to which it assures the replacement of the population. This question exercised demographers greatly between the wars, but the analytical tools then available made it difficult to give a satisfactory answer. The reproduction rates used for the purpose were a very convenient summary of the fertility rates of a particular year, though usually of rates specific for age of mother only, and as such an advance on earlier measures. But by the same token they were subject to the distortions of data relating to a short period rather than to a group of people, and therefore misleading as a gauge of current fertility habits. As we have seen it is necessary to adopt the cohort approach if this danger is to be avoided.

Since then a great deal of study has been devoted to the subject, and the advances made so far may be summed up as follows.

First, more detailed fertility rates have been used in the measurement of replacement, in an effort to specify more explicitly the assumptions made. For any period reproduction rate, considered as a measure of current habits, assumes the indefinite continuance of the rates used in its calculation. The more specific those rates are, the more closely it is seen just what is assumed, or implied by the assumption of constant rates, and particularly whether in the long run the assumptions look realistic or at least are compatible with each other. In particular attention has been given to the incidence of marriage, and to the ratio of men to women in the population. The latter affects both current marriage rates and proportions married, and future prospects, and if it is temporarily abnormal measures of replacement based on the fertility of women only may become misleading.

Secondly, replacement rates have been calculated on the basis of generations of marriage cohorts instead of on that of the rates of a year or similar period. The advantages of this approach will be obvious from the preceding discussion. Its chief disadvantage is that the cohorts concerned in *current* fertility habits are, of necessity, still far from completing their families. But this weakness is more apparent than real, for it is just the cohort approach which makes possible a realistic projection of the ultimate family size of groups whose fertility is still incomplete, and to assess whether current fertility rates are likely to be much distorted or not. For example, the rates of 1951-55, when analysed in this way, seemed close to stability, and the mean family sizes obtained by cumulating them are close to the trend shown by cohorts whose families are nearing completion.

Lastly, it has come to be recognised that there is no unique or "right" measure of replacement, but only a range of rates. In the case of cohorts of completed fertility they depend on whether they are based on males, females, or a combination of them, and on the age at which replacement is considered, e.g. birth or the mean age at maternity. In the case of later cohorts (whose fertility is not yet complete) or of hypothetical rates summarising current habits the measures used depend in addition on the assumptions made about future marriage and death rates, and judgment must be employed in their use.

* In this country at least, the priorities in medical care and food rationing given to expectant and nursing mothers and their children may also have played a part.

1923-28	34	318	612			
1928-33	45	335				
1933-38	49					

If the cohort approach is used to analyse replacement the most natural group to use is the generation. The simplest method is to calculate a generation life table, say for the females born in a particular period, showing the number of years of life lived in each age-group by the survivors of, e.g., 1,000 original births, and to multiply these by the simple female age fertility rates.* This gives the average number of girl babies in the next generation per 1,000 female births in the original generation. The results of such a calculation are shown in Table 4.13⁺, the last column of which gives replacement rates for generations whose fertility was complete by the end of 1955. The table shows that the number of female births to the last generation of women before the spread of family limitation was about 40 per cent above replacement level, that it declined to about 30 per cent below replacement level for the generations born in the early years of this century, and that it has been rising vigorously since then.

Another method is to take explicit account of marriage, by calculating the average number of marriages in each age-group, or of years of life lived in the married state by marriage age and duration, by females (or males) in the original generation, and combining these with mean family sizes or duration fertility rates to estimate the number of children in the second generation.^ø Account should be taken of widowhood, divorce, remarriage and illegitimate fertility. This method is much more laborious, but has advantages in analysing the changes in replacement rates between different generations and in projecting the rates for generations whose fertility is as yet incomplete.

In either case replacement rates may be computed for different ages, according to whether interest lies in the replacement of the original births by the next generation of births, or of the number of women at the beginning of the reproductive period or at the average age at maternity, and so on.

* Live female births to mothers in a given age-group per 1,000 women in the age-group, irrespective of marital condition.

⁺ Quoted from *The Registrar General's Statistical Review of England and Wales for the Five Years 1946-50*, Text, Civil, p. 220. Data for 1951-55 have been added. For similar estimates see also Glass and Grebenik, *op.cit.*, Appendix 3 to Chapter 7 (pp. 278-285), especially pp. 284-285, and Pascal K. Whelpton, *Cohort Fertility: Native White Women in the United States*, Princeton University Press, 1954.

^ø See Glass and Grebenik, *loc.cit.*

Replacement rates may also be computed for marriage cohorts, showing whether they replaced (or are expected to replace) themselves by a similar number of marriages. Such rates are of more limited usefulness.

On the other hand it is always possible to calculate a hypothetical replacement rate on the assumption that certain rates of fertility, nuptiality (both first marriage and remarriage), mortality, widowhood and divorce will continue. If cohort analysis has indicated that a certain set of such rates apparently represents a fairly stable pattern in a population, such replacement rates will come close to a realistic assessment of current demographic behaviour.

A Nuptiality Table for England and Wales by Duration of Marriage.-

It has been shown earlier in this chapter that mean ultimate family sizes in England and Wales at the present time present an appearance of considerable stability. The most recent fertility rates, those of the early nineteen-fifties, also look fairly stable and free from distortion. Cumulating the average rates for 1951-55 gives mean family sizes which are quite well in line with recent cohort trends, though perhaps slightly larger than the mean family sizes of the most recent cohorts now reaching completion. They therefore represent current habits sufficiently well to make it worth bringing out their implications for replacement by the kind of hypothetical calculation just referred to.

The first stage was to calculate a female nuptiality table for England and Wales by duration of marriage. This has been done in Appendix 2 to this chapter (p.cviii). Rates of first marriage are not changing very rapidly at present (though there is some continuing tendency towards younger marriage), and do not seem to be unduly distorted by temporary influences. The mean marriage rates by age for the years 1951 to 1955, separately for first marriages and remarriages, were therefore used. The mortality basis was that of the English Life Tables No. 11 (1950-52), without taking account of marital condition differentials - the difference they would have made was small compared with the practicable degree of approximation and with the labour involved. The widowhood and divorce rates used were those of 1953.

The results are shown in Table 4.2.2 in Appendix 2. Out of a hypothetical generation of 100,000 liveborn girls, 96,560 would survive to their 16th birthday and 92,527 to their 45th. 90,520 would get married before their 45th birthday, and there would be 7,387 second and later marriages among them by that time. Of the total first marriages under age 45, 23 per cent would occur under age 20, 58 per cent at ages 20-24, and 14 per cent at 25-29 (altogether 94 per cent under age 30). The proportions married among the survivors are shown in Table 4.14. They are higher than any so far recorded in this country, as is clear from Table 4.15.

1951	848	780
Net Nuptiality of 1951-55	945	867

* Estimated from data for age-group 45-54.

Fertility Rates of 1951-55.- Tables 4.16-18 give the fertility rates used. Those for women married once only (Table 4.16) are obtained by averaging the last four diagonals in Tables E.2-7. Those for women married more than once (Table 4.17) are derived from Table 4.16 by multiplying the rates by the ratio of fertility rates of remarried to those of once-married women in 1952. The illegitimate fertility rates (Table 4.18) are, of course, specific only for mother's age at maternity, while the others are specific for age at, and duration of, (current) marriage. They also differ from the others in referring to female births only.

**Table 4.18. - Mean Illegitimate Female Fertility
Rates in 1951/55**

(Live female births per single, widowed or divorced woman)

Age of Mother at Maternity	Female Fertility Rate
15 - 19	.00193
20 - 24	.00641
25 - 29	.01021
30 - 34	.01047
35 - 39	.00652
40 - 44	.00216
45 - 49	.00013

Hypothetical Replacement Rates.- Multiplying the fertility rates by the population of women in the nuptiality table gives the expected number of live births, shown in Table 4.19. They give a female replacement rate, according to the female nuptiality of 1951-55, of 1.01. In other words the expected number of girl babies in the second generation is 1 per cent greater than that needed to replace those in their mothers' generation.

Table 4.20. - Hypothetical Replacement Rates summarising Current Habits on different Assumptions

	Assumptions	Rate
	Fertility rates of 1951-55 (mean ultimate family size 2.278):-	
(1)	Female nuptiality of 1951-55 (maximum proportion of women ever-married 95 per cent)	1.014
(2)	Male nuptiality of 1951-55	1.055
(3)	Mean of (1) and (2)	1.035
(4)	Maximum proportion of women ever-married 90.5 per cent (marriage age structure as in (1))	.965
	Mean ultimate family size 2.152 (1943 marriage cohort):-	
(5)	Mean of male and female nuptiality of 1951-55	.978
	Mean ultimate family size 2.386 (annual rates suggested by births of first quarter of 1957):-	
(6)	Mean of male and female nuptiality of 1951-55	1.084
(7)	Mean of (5) and (6)	1.031

But this figure is not to be regarded as the unique or "correct" measure of present conditions. A number of others have been computed by short-cut methods giving a sufficient degree of approximation,* and some of them are shown in Table 4.20.

In the first place account has been taken of male instead of female nuptiality in 1951-55, which results in a somewhat larger number of marriages and hence a replacement rate of 1.06. In other words the marriage rates of women in those years, although at a record level, were still kept down slightly by the shortage of men, although this shortage has been easing for some time and has nearly disappeared. Since the number of marriages must be the same for men and for women, their marriage rates would be expected, other things being equal, to move into harmony, giving a replacement rate somewhere between 1.01 and 1.06, say 1.03. On the other hand, the maximum proportion ever-married implied even by the female nuptiality table, 95 per cent, is so high that it might be thought

* See Appendix 2 to this chapter, p.cx.

prudent to assume a lower level, say 90 or 91 per cent. (In the actual population in 1956 it was 89 per cent and rising slowly.) If the marriage age structure were unchanged this would reduce the replacement rate from 1.01 to 0.96, but in practice the young ages would be less affected (their marriage rates are still rising) and a rate nearer to full replacement (1.00) would probably be achieved.

Again it may be that the fertility rates used are slightly too high, since their sum (2.28) exceeds a little the probable mean ultimate family size of cohorts now nearing completion. If they were reduced to give a mean family size similar to that of the 1943 cohort (2.15), then the replacement rate, with marriage intermediate between the male and female nuptiality of 1951-55, would be about 0.98, or 2 per cent short of replacement. On the other hand the number of births has been rising since the latter part of 1955. Too much should not be read into short-term movements, but taking as a maximum some rates suggested by the provisional figures for early 1957 we get a mean ultimate family size of 2.39 and a replacement rate of 1.08. The mean between these last two extremes is again 1.03.

Turning from modifications of the nuptiality and fertility assumptions to those about mortality, it may be noted that death rates at young ages have been declining continuously for a long time. The scope for further improvement is limited, but may well suffice to raise replacement rates calculated in the way described by about 1 or 2 per cent per decade in the immediate future. In other words, if the above calculation were repeated using the mortality of 1960-62 the result would perhaps turn out to be 1.03 or 1.05 instead of 1.01 or 1.03.

To sum up, there is no precise or unique measure of replacement, but the indications are that current habits imply, *in the long run*, approximately full replacement of one generation by the next, and possibly a very little more. This is slightly higher than was indicated by the data used in the Report of the Royal Commission on Population* and in the Report on the Family Census of 1946†, though the difference is not great when measured against the great changes which have taken place over the last twenty or thirty years. It should be remembered that both sets of figures relate to hypothetical calculations of long run effects, and not to the experience of any of the generations now marrying or bearing children, whose past experience (particularly of mortality) has been much less favourable.

Generation Replacement Rates.— Returning from the measurement of current habits to that of the replacement of actual generations, the same short-cut methods as before have been used to compute the replacement rates presented in Table 4.21. They are confined to females and to replacement at birth; taking account of males would give slightly higher values.

Table 4.21. - Generation Replacement Rates (Female Births), 1903-08 to 1948-53, calculated from Age Marriage Rates and Mean Ultimate Family Sizes by Marriage Age.

(Figures in brackets include an element of projection exceeding 10 per cent)

Generation born in	Replacement Rate
1903-08	.672
1908-13	.730
1913-18	.795
1918-23	(.849)
1923-28	(.910)
1928-33	(.938)
1933-38	(.964)
1938-43	(.978)
1943-48	(1.000)
1948-53	(1.014)

* Cmd. 7695. 1949.

† Glass and Grebenik, *op.cit.*

The first two values are for the generations born in 1903-08 and 1908-13, whose fertility was for practical purposes complete by 1955. They agree well with those in Table 4.13, computed from age fertility rates without taking explicit account of marriage. The values for later generations have been projected beyond the point reached in 1955 by assuming that the average marriage and fertility rates experienced in 1951-55 and the mortality of 1950-52 will continue. They rise from the minimum of just under 70 per cent of replacement for the 1903-08 generation to unity for that of 1943-48 and, for those born in 1948-53, to the hypothetical value of 1.01 previously calculated.*

Table 4.22. - Analysis of Increase in Projected Female Replacement Rate of 1948-53 Generation over those of 1903-08 and 1918-23

(All figures calculated before rounding off)

Generation	1903-08	1918-23	1948-53
Estimated female replacement rate	.672	.849	1.014
Approximate increase to 1948-53 generation due to change in:-			
All factors	.342	.165	
Fertility	.078	.023	
Nuptiality	.100	.035	
Mortality	.164	.107	
Approximate percentage increase due to change in:-			
All factors	51	19	
Fertility	12	3	
Nuptiality	15	4	
Mortality	24	13	
Approximate percentage share of total increase due to change in:-			
All factors	100	100	
Fertility	23	14	
Nuptiality	29	21	
Mortality	48	65	

This represents a rise of 51 per cent over the value for the 1903-08 generation, and 19 per cent over that of 1918-23, the last one for which the element of projection amounts to less than 20 per cent of the total value. In Table 4.22 these increases are analysed into their constituent parts. The figures are only approximate, but give a sufficient indication of the relative importance of the different factors.

About half the total increase since the generation of 1903-08, and about two thirds of the increase since that of 1918-23, has been due to the improvement in mortality, mainly infant mortality. This has raised the replacement rate by about a quarter since the former generation and by about an eighth since the latter.

Something like a quarter of the total increase over the earlier generation, and a seventh of that over the later one, is attributable to the slight increase in mean family size, which has raised the rates by about 12 and 3 per cent respectively.

The increase in marriage accounts for the remainder of the rise in the current level, between a quarter and a third of the rise over the level of the first group and about a fifth of the rise over that of the second, making increases of about 15 and 4 per cent respectively in replacement rates.

* The values in Table 4.21 consistently lie between the two series projected by Carrier (*op.cit.*), approaching the higher one for most of the later generations.

Diagram 4.20. - Generation Replacement Rates
(Female Births), 1838-43 to 1948-53

About four fifths of the recovery in the degree to which each generation is replaced by the next has therefore been due to the improvement in the prospects of survival and marriage. Not very much further help is to be looked for from these sources, since the proportions of females dying in infancy or remaining unmarried have both become very small. It seems, then, that the average size of families is becoming the determining factor. In view of the appearance of stability in it which is shown by the cohort analysis, the study of generation replacement rates confirms the conclusion that, on present prospects, these rates are likely to remain at or just above unity for some time to come. It should also be remembered that replacement need not mean replacement of births by births, as it did in the figures so far quoted. It is equally possible to consider it at a later age, such as the beginning of the reproductive period or the mean age at maternity. In practice this means taking account of the difference in mortality between the two generations. Owing to the continuous improvement in survivorship, generation replacement rates considered at early adult ages exceed birth replacement rates by amounts which have hitherto been of the order of 10 per cent. They should become smaller in future, because there is less and less room for further increase in the proportion of live-born girls surviving to age 15 or 30. As a result rates of this type would, on the assumptions made, reach or surpass unity with the 1923-28 generation instead of that born in 1943-8, but might not exceed 1.04 even for that of 1948-53.

In other words, unless there are great changes in economic and social conditions, or another revolution in people's attitude to marriage and the raising of children (of which there is no sign at present), the population will continue to replace itself, perhaps even with a little to spare.

APPENDIX 1 TO CHAPTER 4

THE INTEGRATION OF DATA FROM THE SAMPLE FAMILY CENSUS OF 1946, BIRTH REGISTRATION AND THE CENSUS OF 1951

Tables D and E present a continuous series of fertility statistics for all the marriage cohorts since 1920. For their compilation it was necessary to link data from three different sources: the Family Census taken in 1946 for the Royal Commission on Population, the material collected each year at birth registration under the Population (Statistics) Act, 1938, and the Census of 1951. None of these data are strictly comparable with each other, and all have different weaknesses as well as advantages. Their integration therefore presented considerable technical problems, and these, together with the procedure used to overcome them, will now be briefly described.

1. The Sample Family Census of 1946

The Royal Commission's Family Census, covering a sample of 8.7 per cent of all women in Great Britain who were or had been married, provided the starting point of the series and also the basis for over half the results. This is because it covers in detail events up to 1945, and in particular before the coming into force of the Population (Statistics) Act on 1st July, 1938. The data are in convenient form, being arranged in calendar year marriage cohorts subdivided into marriage age group and showing, e.g., the family size of each cohort age-group after each year of marriage duration.* Most of them relate to women married once only. The published material relates mostly to Great Britain, but the unpublished figures for England and Wales have been used in this Report.

They are subject to the following weaknesses:-

(a) *Sampling Errors.* - Even a sample as large as 9 per cent is naturally subject to chance variations of selection in addition to those which occur in the (finite) population sampled, and in the case of survivors to census date of those married two decades or more previously the numbers are still further reduced. But these fluctuations are not sufficient to distort the general picture. They should be kept in mind when using fertility rates which are small in themselves (e.g. those at long durations) or based on a small number of women (e.g. those married at relatively high ages - cf. Table E.7).

(b) *Understatement of Childlessness.* - The Family Census was a voluntary enquiry and achieved the relatively very good response rate of 87 per cent of the final sample, i.e. little more than one in eight of the women selected to whom the questionnaire applied failed to return it completed. But even this amount of response failure gave rise to some biases which affected the calculations.

The first of these was an understatement of the proportion of childless women, response failure being more frequent among them than among

* It should be noted that the durations are the differences between the calendar months of marriage and maternity, as are those in the birth registration statistics before 1952. The true interval may thus be up to a month greater or less than the counted interval, duration "11 months" (e.g.) ranging from 10 to 12 (exact) months, duration "12-23 months" from 11 to 24 months, and so on. Hence the durations shown are on average half a month shorter than is indicated by their name in round completed years or months. The few births which occurred in the same calendar month as the marriage are counted as occurring before it in the Family Census; the registration statistics by marriage duration necessarily include only those which occur after marriage and count them as such.

In some of the family size tables of Part I of the Family Census Report (Glass and Grebenik, *op.cit.*) the term "completed years" defining the marriage durations is used as the equivalent of "exact years" as used in Part II and in the present volume. In this volume (e.g. Tables E) it has been confined to its more usual meaning of "years at last wedding anniversary".

† Glass and Grebenik, *op.cit.*

fertile women. The Family Census Report explains how the figures for Great Britain were corrected for this by applying ratios derived from data for women who answered the questions only after receiving a "follow-up" letter. The Family Census statistics used in the present Report were corrected by multiplying them by the same factors.

(c) *Understatement of Premarital Conceptions.* - The Family Census Report (Appendix 3 to Chapter 6, pp. 138-145), in comparing the premarital conception rates⁰ in the years 1939-44 among all women married under age 45 combined⁺, drawn from the Family Census material, with those from birth registration statistics, notes that on the whole the former are slightly smaller, and appreciably smaller in 1939. This fact is also reflected in the comparison of the rates at duration under one year (more strictly $\frac{1}{2}$ - $11\frac{1}{2}$ months) and under half a year ($\frac{1}{2}$ - $6\frac{1}{2}$ months), given in Tables 4.1.1 and 4.1.2.⁺ They show that the discrepancy, small in later years, was as great in 1938 as in 1939.

Table 4.1.1. - Percentage Excess (+) or Deficiency (-) of Fertility Rates at Marriage Duration $\frac{1}{2}$ to $11\frac{1}{2}$ months derived from Family Census Data compared with those derived from Birth Registration Data, 1938-1944

(Live Births per Woman Married Once Only. Family Census data adjusted for understatement of childlessness.)

40-44	-47	-9	+3	-34	-7	-11	-4

Table 4.1.2. - Percentage Excess (+) or Deficiency (-) of Fertility Rates at Marriage Duration $\frac{1}{2}$ to $6\frac{1}{2}$ months derived from Family Census Data compared with those derived from Birth Registration Data, 1938-1944

(Live Births per Woman Married Once Only. Family Census data adjusted for understatement of childlessness.)

Age at Marriage	Year of Maternity						
	1938	1939	1940	1941	1942	1943	1944
Under 20	-26	-26	-9	-15	-15	-15	-14
20-24	-23	-26	-3	-9	-16	-12	0
25-29	-26	-29	+7	-1	-8	-12	-2
30-34	-22	-32	+7	-1	-17	-28	-7
35-39	-54	-38	-7	-10	-37	-29	-6
40-44*	-41	+21	-39	-13	-8	+16	-9

* The figures for marriage age-group 40-44 are based on very small numbers of births in the Family Census sample.

⁰ Proportions of women having a child within $8\frac{1}{2}$ months of marriage.

⁺ First marriages only.

⁺ Detailed data for duration under $8\frac{1}{2}$ months are not available from the Family Census, and the rates from birth registration statistics have been adapted by estimation to the duration intervals of the former, and converted to the same basis of woman married once only, integral marriage age groups and live births. The Family Census rates for calendar year marriage cohorts have been interpolated to calendar year of maternity by taking the unweighted mean for duration $\frac{1}{2}$ to $11\frac{1}{2}$ months and the mean weighted by the proportions 0.3 and 0.7 for duration $\frac{1}{2}$ to $6\frac{1}{2}$ months. This simple procedure actually gives somewhat better results than that used on pages 139-140 of the Family Census Report, because the latter's careful estimate of the maternities (the numerator) is not matched by an appropriate one of the exposed to risk (the denominator).

The Family Census Report points out that the smaller differences in later years might well be explained by less accurate replies on the Family Census schedules than at birth registration, and some understatement of premarital conceptions would be expected from experience with other censuses, especially since in this case it was a voluntary enquiry. But the Report suggests that the larger difference in 1939 may be due to faults in the registration statistics, since the question about duration of marriage was only asked from 1st July, 1938. Yet this is unlikely to account for a large part of the discrepancy, as can be seen from the fact that at longer durations all the differences were smaller than in the first year of marriage except in cells where the number of births in the Family Census sample was very small (Table 4.1.4), and from the following statement.

Proportion of legitimate maternities for which the duration of marriage was not stated

1938	1939	1940	1941	1942	1943	1944	1945
.0125	.0111	.0107	.0098	.0073	.0072	.0062	.0060

On the other hand the fall in the difference between the two sets of rates coincides in time with the fall in the rates themselves which occurred on the outbreak of war. (See Table 4.1.3.) The fall in the rates was partly due to the fact that in many cases of premarital conceptions where the parents would normally have married before the birth of the child the call-up and generally the disturbed conditions of war-time prevented a marriage, so that the child was born illegitimate instead, and partly to the very large number of marriages contracted in 1939 and 1940 under the stimulus of war. The first factor reduced the numerators of the rates, while the second increased the denominators. This is a sufficient explanation of the decline between the maternities of 1938 and 1939 (also indicated by the Family Census data), so that no appreciable error need be suspected in the rates of the earlier year, based on registrations from July onwards.

Table 4.1.3. - Fertility Rates at Marriage Duration $\frac{1}{2}$ to $11\frac{1}{2}$ months derived from Birth Registration Data, 1938 - 1944

(Live Births per Woman Married Once Only.)

Age at Marriage	Year of Maternity						
	1938	1939	1940	1941	1942	1943	1944

Table 4.1.4. - Percentage Excess (+) or Deficiency (-) of Fertility Rates at different Marriage Durations derived from Family Census Data compared with those derived from Birth Registration Data, 1938

(Live Births per Woman Married Once Only. Family Census data adjusted for understatement of childlessness.)

Age at Marriage	Marriage Duration in Completed Years (less $\frac{1}{2}$ month)									
	0-	1-	2-	3-	4-	5-	6-	7-	8-	9-
Under 20	-17	+10	-5	-13	-3	-9	-4	-9	-11	+6
20-24	-13	+2	-2	+3	-1	+1	+8	+7	+9	+8
25-29	-16	+5	+5	+6	+5	+7	+12	+12	+5	+5
30-34	-20	+7	+4	+12	+4	+14	+11	-11	+12	+25
35-39*	-36	+28	+6	+22	+8	+44	+23	-4	+22	+99
40-44*	-47	+31	+32	+203	-35	-22	+157	-39	0	-100

* Most of the figures for marriage age groups 35-39 and 40-44 are based on very small numbers of births in the Family Census sample.

The figures were rated up to the whole year (for which the number of births by legitimacy was known, but not their distribution by mother's age and marriage duration) on the assumption that the seasonal distribution of premaritally conceived legitimate births is similar to that of illegitimate births.

It is likely that the decline in the difference between the two measures of the incidence of premaritally conceived legitimate births is connected with the decline in the incidence of such births. If so the difference is probably due to mis-statements on the Family Census schedules or to a tendency for such mothers not to complete the schedule, i.e. to response bias. As relatively little compensating increase is visible in those rates which would have been inflated by mis-statement, response bias is likely to be the greater part of the trouble. It is true that the rates in Table 4.1.3 fell between 1938 and 1940 by only about 30 per cent, while the percentage deficiencies in Table 4.1.2 nearly disappeared. This could happen if the women concerned were not a homogeneous group, either with regard to the fall in rates or in their response to the Family Census, and there is no particular reason why they should be.*

Table 4.1.5. - Ratios of Mean Family Sizes (excluding births before marriage) at different Marriage Durations derived from Family Census Data to those derived from Birth Registration Data. Notional Marriage Cohort 1937-38

(Live Births per Woman Married Once Only. Family Census data adjusted for understatement of childlessness.)

Age at Marriage	Marriage Duration in Exact Years (less $\frac{1}{2}$ month)						
	1	2	3	4	5	6	7
Under 20	.827	.922	.929	.934	.941	.952	.954
20-24	.872	.948	.957	.982	.983	.991	.992
25-29	.839	.925	.954	.971	.971	.983	.989
30-34	.797	.922	.949	.969	.967	.981	.987
35-39	.638	.839	.906	.904	.896	.897	.921
40-44	.530	.788	.970	1.021	1.067	1.056	1.018

In the circumstances it is reasonable to assume that the incidence of premarital conceptions is understated in the Family Census data for peace-time cohorts to an extent similar to that apparent among the births of 1938. It seems from the ratios of the mean family sizes (excluding children actually born before marriage) by duration, i.e. of the cumulated rates, that the bias gradually diminishes and has more or less disappeared after 6 or 7 years of marriage. This is illustrated for the "notional cohort" 1937-38 in Table 4.1.5.† It suggests that the difference between the women who, having borne a legitimate child conceived before marriage, did not respond to the Family Census enquiry, and other women is largely one of timing over the first few years of marriage, not of ultimate family size.

This result, though a little surprising, made it possible to correct the Family Census data relating to pre-war cohorts for the understatement of premarital conceptions by a relatively simple method. For each age-group at marriage, the mean family size (excluding births before marriage) after 1 and 7 years of marriage respectively, estimated from registration statistics for the "notional cohort" 1937-38, was divided by the corresponding figure from the Family Census. The ratio of this quotient for duration 1 to that for duration 7 was used as a correcting factor for all the cohorts up to 1938 inclusive, i.e. the fertility rates for the

* To take but one possibility, some of the mothers involved may decide on marriage only after conception, while others are already intending to get married when they conceive. The war-time transfer to the illegitimate class may well have affected the first group of maternities more, and the two groups may, on average, have reacted differently to the census enquiry.

† See p.xcix below.

‡ It accounts for the fact that the discrepancy does not show itself in the tables of Chapter 5 of the Family Census Report, "The Question of Bias", e.g. in the comparison of average number of children borne by census date per fertile woman in Table 8, col. (7) (page 60).

first year of marriage (the family size at duration 1 excluding births before marriage) were multiplied by it. The family sizes at durations 7 and over were left unchanged, and those at durations 2 to 6 adjusted so as to taper off the correction made at duration 1 with the minimum disturbance to the pattern of annual fertility rates.

The war-time cohorts showed far less evidence of systematic understatement, and explanations of the occasional irregularities in the data were less obvious. Their figures were therefore left unadjusted. No entirely satisfactory treatment of the 1939 cohort could be found, because the registration and Family Census data spanned the outbreak of war in different ways. After some experimenting, average family sizes (excluding births before marriage) for women married in 1939, based on registration statistics, were interpolated linearly between those of the "notional cohorts" 1938-39 and 1939-40 in proportion to the relative contribution made to a full year's exposure to risk of legitimate maternity for each cohort by marriages after mid-1939. These figures were divided by the corresponding ones from the Family Census for the 1939 cohort. The ratios of the quotients for duration 1 to those for duration 6 were then formed, and used as correcting factors in the same way as before, except for some slight adjustments mostly to allow for the fact that duration 6 had to be used instead of duration 7 which was not available from the Family Census.

The factors applied to the fertility rates for the first year of marriage were as follows:-

Age at Marriage	Marriages of	
	1920-1938	1939
Under 20	1.15660	1
20-24	1.13936	1
25-29	1.18184	1.1
30-34	1.23775	1.2
35-39	1.44027	1.05
40-44	1.91712	1

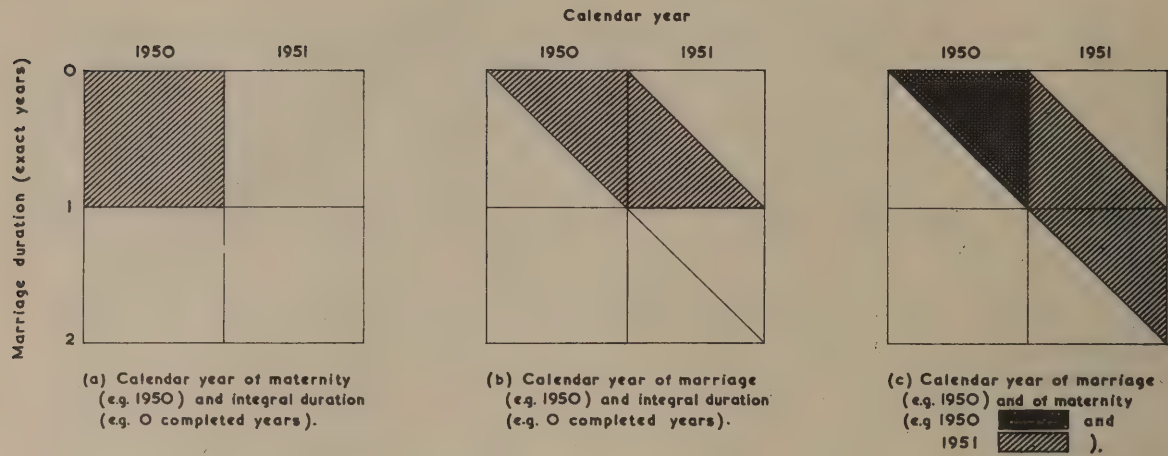

(d) *Marriage Durations.* - As explained in footnote * on p.xcv, the marriage durations in the Family Census statistics, like those in the registration statistics before 1952, are on average half a month short of the number of years stated. In order to put them on the same basis as the figures for recent years they were therefore adjusted to exact durations by interpolation (using simple 4-point Lagrange formulae; see 2(e) below).

2. The Registration Statistics

Statistics of births, and hence the fertility rates based on them and the average family sizes estimated by cumulating those rates or derived from a census enquiry, can be assembled in a variety of ways. They are best illustrated graphically, as in Diagrams 4.1.1 and 4.1.2. The first compares various types of fertility rates, or of parts of them representing average additions to family size in parts of a year, such as the period between census date and the integral duration (i.e. wedding anniversary) reached in 1951. The second shows the mean family sizes of two types of marriage cohort, the "notional" one built up by cumulating fertility rates by year of maternity and integral marriage duration, and the calendar year cohort whose fertility rates by integral marriage duration are each derived from births in two calendar years. The other sections of this diagram compare the mean family sizes of calendar year cohorts at different types of date in the year, the fixed calendar date (31st December or census date) and the fixed (integral) marriage duration which ranges throughout the year according to each woman's wedding anniversary.

Diagram 4.1.1. - Types of Fertility Rates

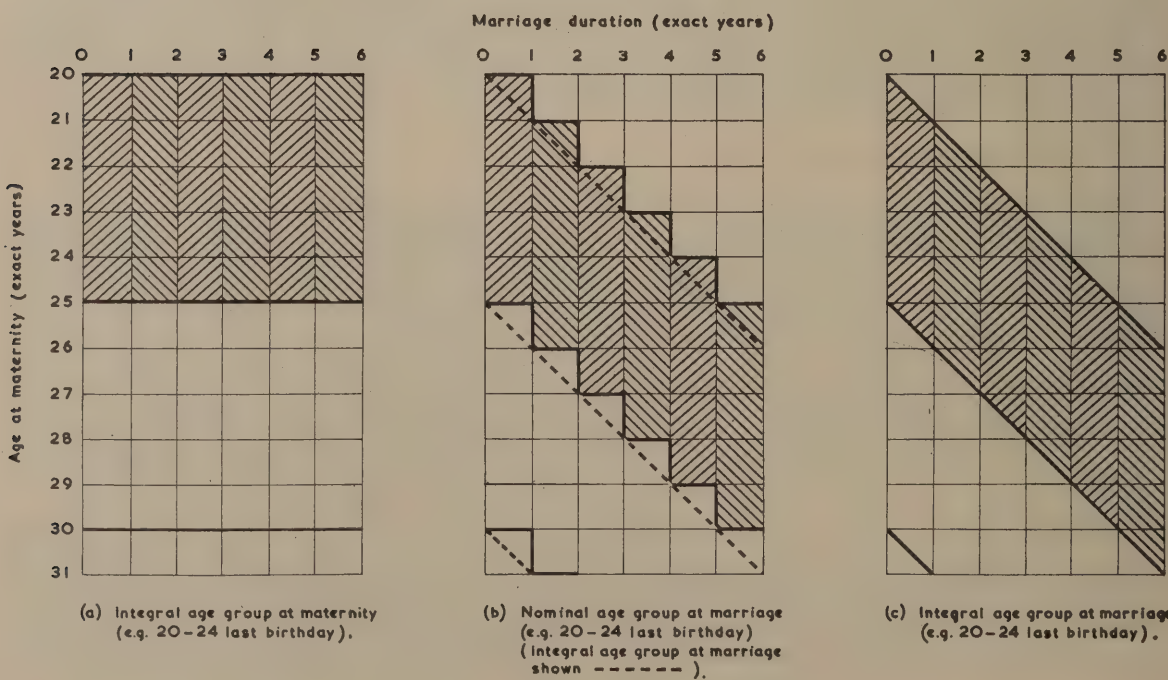

A. Years of marriage, maternity and duration

B. Average addition to family size in parts of a year, for calendar year cohorts

C. Mother's age and marriage duration.

* Where the wedding anniversary falls before 8th April the addition to family size between the two dates has to be counted negatively to calculate the net addition to family size between census date (the vertical line) and the integral duration (the horizontal line).

Diagram 4.1.2. - Types of Mean Family Sizes

(a) Notional cohort (e.g. 1937-38) and integral duration.

(b) Calendar year cohort (e.g. 1937) and integral duration.

(c) Calendar year cohorts, mean family size at integral duration reached in 1951.

(d) Calendar year cohorts, mean family size reached at (i) Census date, 8th April, 1951, and (ii) 31st December, 1951.

The Family Census data are in the form illustrated in Sections A(b) and C(c) of Diagram 4.1.1 and Section (b) of Diagram 4.1.2. Some of the registration statistics are in the form of Sections A(a) and C(a) of the first. Those used for compiling Tables D and E and relating to 1952 and later years were mostly in the form of Section A(c) and C(c) of the first and Section (d) (31st December) of the second diagram, i.e., they were classified by integral marriage age and calendar years both of marriage and of maternity. The fertility rates therefore had to be split by estimation into the two parts shown in Sections B(a) and (b) of Diagram 4.1.1 and reassembled into the rates of Section A(b).^{*} Otherwise they were exactly in the form needed, relating to once-married women and to the full range of single calendar years of marriage.

It is not possible, however, to obtain at the registration of legitimate births the number of children born to the mother before marriage. The mean number of those recorded in the Family Census for the 1945 cohort, by age at marriage, has therefore been used for later cohorts.

The registration statistics which had to be used for births before 1952 presented much greater problems.

(a) *Women Included.* - These rates related to *all* married women, classified by their current marriage, and not only to the once-married. A special tabulation of maternities in 1952 to remarried women was made,[/] and in the absence of other data it was assumed that the ratios of their fertility rates to those of once-married women held good approximately in earlier years. The proportion of remarried women (by age at current marriage) in each cohort was estimated from the marriage statistics, and hence the ratios of once-married to all women's rates computed.

(b) *Maternities.* - The rates were in the form of maternities per married woman, and had to be converted to the basis of live births, using the appropriate ratios of live births to maternities by age of mother.

(c) *Marriage Age.* - The rates were in the form shown in Section C(b) of Diagram 4.1.1, i.e., by nominal marriage age. They had to be interpolated to integral marriage age groups (Section C(c)), using 4-point Lagrange coefficients related to the mean ages of the groups concerned, in so far as this had not been done already;[#]

(d) *Marriage Cohorts.* - They related to notional marriage cohorts (Section (a) of Diagram 4.1.2). The interpolation to calendar year cohorts had already been done for the births of 1946-50[‡]; for those of 1951 it was carried out by splitting the rates into their two parts (Diagram 4.1.1, Sections B(a) and (b)) and reassembling them into the rates of Section A(c). This, however, left the rates for all six years in calendar years of maternity as well as marriage, and they had to be converted to integral durations by calendar year of marriage. That was done by linear interpolation, except for the marriages of 1950, for which a more sensitive estimate was wanted for comparison with the 1951 Census data. It was made by splitting the rates of 1950 and assembling them together with the corresponding parts of the 1951 rates into the fertility rates of the first year of marriage for the 1950 cohort (Section A(b)).

(e) *Marriage Durations.* - The durations identified, like those of the Family Census data, were differences between the calendar months of marriage and maternity, i.e. half a month short of integral years on average. The mean family sizes were interpolated to integral years of duration after the Family Census data had been brought up to 1951 by adding those from registration statistics.

^{*} As from 1956 the annual tabulations will provide the data directly in this form.

[/] See *The Registrar General's Statistical Review of England and Wales for the year 1955*, Part III, Commentary (pp. 29-34 and 252-271).

[#] See (f) opposite.

(f) *Durations over 10 Years.* - Single years of duration were only available for the first ten years of marriage. Beyond that the figures were confined to five year duration groups by single years of age at *maternity* (similar to Section C(a) of Diagram 4.1.1, but with the columns grouped and the lines in single years). Fortunately those relating to the maternities of 1946-50 had already been interpolated to single calendar years of marriage and integral marriage ages for the Family Census Report*, as had also been done for the shorter durations. The maternities of 1951 were split into single years of duration on the basis of those of 1952 (taking account of the half-month's difference in the definition of marriage duration). Rates by nominal marriage age group could then be calculated, and converted to the required form as before.

(g) *Base Populations before 1951.* - All the rates before 1951[/] were based on population estimates made before the 1951 census data were available. They related mostly to the abnormal war and post-war periods, and during the latter in particular there was a good deal of population movement, especially migration, which of necessity could not be recorded in the considerable detail of a population estimate by age and marriage duration. But the comparison to be mentioned later showed that any errors from this source were not large enough to necessitate an attempt to revise the estimates backwards from the 1951 Census. The problem could be taken care of by the adjustment procedure described in Section 4 below.

3. The Census of 1951

The main data used from the 1951 Census were a tabulation of once-married women by calendar year of marriage, age at marriage in the usual five year groups and size of family at census date, adjusted for understatement of remarriage as described in Chapter 1. They were thus in the form of Section (d) of Diagram 4.1.2, and the definitions and detail as required. Two weaknesses remained:-

(a) *Premarital Births.* - As explained in Chapter 1 the census figures of family size almost certainly include some children born before marriage, but not all, and there was some evidence that the number excluded might be about half the total suggested by the Family Census data. The 1951 Census figures were therefore increased by that amount.

(b) *Adjustment for Understatement of Remarriage.* - The adjustment for understatement of remarriage could not be perfect, and at short durations and high marriage ages it probably did not go far enough. The procedure adopted in consequence is dealt with below.

4. Integration of the Three Sets of Data

The fertility rates derived from registration data were added to the mean family sizes derived from the Family Census, after both sets of data had been adjusted in the way described. This gave provisional mean family sizes by marriage age for each calendar year cohort at each integral marriage duration up to that reached during 1951. Comparable estimates of the position reached at integral durations in 1951 (Diagram 4.1.2, Section (c)) were built up from the figures for census date (Section (d)) by adding the average addition to family size between the two dates (Diagram 4.1.1, Section B(c)), estimated from the 1951 fertility rates.

The two sets were, on the whole, very close to each other, with the marked exception of the corner of the table formed by the short durations (recent marriages) and high marriage ages, where the adjustments for

* Glass and Grebenik, *op.cit.*, pp. 260-269 and 257-259. The rates quoted there, which have also been converted to live births and integral durations, are estimates for Great Britain.

[/] Those for 1951 were based on an unpublished population estimate calculated from the 1951 Census.

understatement of remarriage were insufficient and in some cells the pre-1951 population estimates differed more than in most other cells from the figures revised in the light of the census.* On the whole the old population estimates proved, however, to be gratifyingly close to the new ones. The mean family sizes built up from the Family Census and registration data for marriage age 25-29 and the cohorts of 1949 and 1950, marriage age 30-34 and the cohorts of 1947-50, and marriage ages 35 and over (all cohorts) were therefore adjusted for the effect of the population estimate discrepancies on the fertility rates of 1946-51,[/] and in this form adopted in preference to those based on the 1951 Census.

There were two unexplained differences of just under 5 per cent. One was shown by the 1950 cohort at age under 20, where the unweighted mean of the two estimates of family size was adopted. The other, for the 1937 cohort at age 30-34, was probably a fluctuation due to small numbers, and the mean of the two estimates weighted by the relative number of women in that cell in the 1951 and Family Census Samples ($\frac{2}{3}$ and $\frac{1}{3}$) was adopted.

The remaining differences, all under 7 per cent, were concentrated largely among the war-time marriages. The mean family sizes built up from the Family Census and registration data were adjusted by distributing the differences rateably over the fertility rates of 1946-50, except that the adjustment was limited to 7 per cent of these rates and any excess distributed further back over the pre-1946 rates based on the Family Census. This procedure automatically, if in summary fashion, dealt with any appreciable weaknesses in the pre-1951 population estimates as well as in the Family Census. On the whole, however, once the data had been adjusted for their known imperfections, they fitted together well enough to confirm substantially the picture presented.

The next step was to obtain the mean family sizes for all marriage ages under 45 combined as means of those for the six age-groups in each cohort, weighted by the relative numbers of original spinster marriages taken from the marriage statistics. The revised fertility rates were obtained by differencing the series of family size estimates. Finally the whole set was continued to each of the integral durations reached in 1952-55 by adding the fertility rates for those years, transformed by splitting and regrouping from the form of Diagram 4.1.1, Section A(c), to that of Section A(b).

* This comparison of population estimates was made on the basis of all women by current marriage, and was therefore not affected by understatement of remarriage.

[/] The percentage differences between the population estimates for 1951 on the two bases were tapered off (going back in time) on the assumption that the errors had accumulated evenly between marriage and 1951.

APPENDIX 2 TO CHAPTER 4: NUPTIALITY TABLES

(*) Detailed Nuptiality Table by Duration of Marriage for Females under Age 50, England and Wales, 1951-55

For the calculation of hypothetical replacement rates summarising the implications of current vital rates a nuptiality table has been computed. It shows the total survivors of 100,000 live-born girls to each age from their 15th to their 50th birthday, classified by marital condition and by duration of their current marriage, separately for those married once only and those married more than once, on the assumption that they experience the specified rates of marriage, widowhood, divorce and death.

The mortality used was that of the English Life Table No. 11, which relates to the years 1950-52.* No allowance was made for the differential mortality of the single, married, and widowed and divorced, because at the ages where fertility is important the difference made to the resulting replacement rates is too small in relation to the practicable degree of approximation and particularly to the additional labour.

The other rates used are shown in Table 4.2.1, which gives central rates by single years of age.

Table 4.2.1. - Central Rates of Marriage, Widowhood and Divorce, Females, England and Wales

Age last birthday	Marriage 1951-55		Widowhood 1953	Divorce, 1953, at duration of (current) marriage (in completed years)-

* The Registrar General's Decennial Supplement, England and Wales, 1951: Life Tables.

The rates of first marriage and remarriage are means calculated for the five year period 1951-55. Under age 25 the rates for single years of age were computed directly from the total marriages and mean population; at higher ages they were interpolated graphically between those for five year age-groups. The central rates n_x were converted to gross nuptiality rates by the usual formula

$$\nu_x^g = \frac{2-n_x}{2+n_x},$$

and the net nuptiality rates, $\nu_x^n = (1-\frac{1}{2}q_x) \nu_x^g$, were taken for convenience of computation as $\nu_x^n = p_x \nu_x^g$.*

The widowhood rates used relate to the single year 1953, since they are very low at ages where fertility is important, so that the precise period is not critical. For the same reason the central rates by single years of age (interpolated graphically between those for five year age-groups) were taken as adequate approximations to the net probabilities of being widowed within a year of reaching any given age.

These considerations also apply to the divorce rates, which are low in age-duration cells with large numbers of married women. The year 1953 was again chosen, being also fairly free from the disturbances in the number of divorce decrees caused in several recent years by changes in the law. Within the seven segments of marriage duration for which data were available, central rates by single years were interpolated graphically between those for five year age-groups, and taken as adequate approximations to the net probabilities; they were also treated as constant over the duration segment concerned. They were applied equally to first and later marriages, since there are no data on the differentials between them.

Table 4.2.2 summarises the results of the calculations. It shows for each (exact) age and marital condition (separately for first and later marriages) the number of survivors to that age and the number of marriages, deaths, widowhoods and divorces between that age and the next.

Table 4.2.3 gives the number of once-married and of remarried survivors to each age by duration of marriage, the durations shown being in exact years after the birthday following the (current) marriage. Duration 3, e.g., is on average about half-way between the third and fourth wedding anniversaries. The number of survivors shown is therefore near enough the mean exposed to risk of maternity over the duration year concerned. Aggregation for each duration in turn in diagonal bands gives the mean numbers of survivors in five year age-groups at marriage and single years of duration, shown in Table 4.2.4, which have been combined with the fertility rates in Tables 4.16 and 4.17 in the calculation of a replacement rate.

* In the usual notation p_x and q_x are, respectively, the probabilities of surviving for at least a year after reaching age x and of dying within a year of reaching that age. The small difference between the two formulae is compensated, by the time the next birthday is reached, by the simplifying procedure of attributing, in the computation, all deaths between ages x and $x+1$ among women reaching age x in a particular marital condition to women of that condition at the time of death. E.g. spinster brides who die between marriage and their next birthday have been counted as spinster deaths and omitted both from marriages and from deaths of married women.

(b) Replacement Rate Calculations using Abridged Nuptiality Tables

Abridged Nuptiality Calculations. - A less laborious method was needed if replacement rates were to be computed on several different assumptions and for different generations. The detailed table just described made it possible to gauge the degree of approximation of simplified calculations and to apply rough corrections to their results.

Approximate probabilities of first marriage within five years of reaching age x were computed by the formula

$${}_5\nu_x^{gs} = \frac{2 - {}_5n_x^s}{2 + {}_5n_x^s}$$

where ${}_5n_x^s$ is the central first marriage rate for the five year age-group x to $x+4$. The approximate number of first marriages under age 20 was obtained by applying this function to the number of survivors at age 15 (l_{15}), and the number of single survivors at age 20 by subtracting those marriages from l_{15} . Repeating these operations in turn with successive values of ${}_5\nu_x^{gs}$ gave the first marriages in five year age-groups and the single survivors at five year age intervals up to 45. The marriages were then multiplied by the mean family sizes appropriate to each marriage age group to give the expected number of live births in the second generation.* Multiplying by the proportion of females at birth gives the expected number of female births.

With the female nuptiality of 1951-55 and l_{15} from English Life Table No. 11 this gives 101,584 female births per 100,000 births in the original generation, compared with 101,407 from the detailed calculation.

Their ratio gives a correcting factor of 0.9983 which has been applied to the other abridged calculations. It allows in summary fashion for the elements omitted from them, viz., curvature of marriage rates[/], mortality of the single between ages 15 and 50, dissolution of marriages by death, widowhood and divorce, remarriage, and the differential fertility of the remarried. For other experiences than the female nuptiality of 1951-55 the allowance is, of course, only approximate, in fact little more than a token adjustment. But the factor is so near to unity because the omitted elements largely compensate for each other, some tending to raise and some to lower the number of expected children. Similar compensation would occur in other experiences and even in the changes between experiences - e.g. in earlier times with higher mortality at young adult ages there was also less divorce.

Male Nuptiality. - In the absence of data on the mean family size of married men by marriage age use had to be made of the data for women. The total number of first marriages under age 45 computed as above, using the male l_{15} scaled up in the ratio of males to females at birth and male marriage rates, was therefore increased by 1.6 per cent to estimate the number of spinster marriages implied by the bachelor marriages.^φ The replacement rate could then be computed by multiplying the rate calculated on the basis of female nuptiality by the ratio of the numbers of spinster marriages derived from the two computations. It should be noted that this is a *female* replacement rate using male nuptiality. The corresponding male replacement rate would be slightly higher (though implying the same annual rate of natural increase) owing to the difference in the length of a generation between males and females.

* In this procedure premarital births are included in mean family size; in the detailed calculation (which uses fertility rates by duration of marriage) they are included in the computation of illegitimate births.

[/] The above conversion formula using group marriage rates treats the instantaneous rates as changing linearly over a five year age interval.

^φ The total number of marriages of men must, of course, equal the number of marriages of women, but there are slightly more first marriages among women because the proportion of remarriages among men is higher. The proportion of all first marriages which took place under age 45 was the same in 1955 for men and women (0.879).

Generation Replacement Rates. - For the generation replacement rates in Table 4.21 the appropriate l_{15} was estimated from the series of English Life Tables*, and the group marriage rates from the experience of the five year calendar periods most nearly corresponding to the periods when any particular generation group would pass through the age-group concerned. The mean family size for each marriage age group was taken as the average of the mean family sizes of cohorts married at that age in the five year calendar period used to compute the marriages. Otherwise the procedure was that described above. For marriages after 1955 the marriage rates of 1951-55 were used, and the projected part of family size after 1955 was likewise based on that period, being the same as that used for Table 4.2 and Diagrams 4.4-9.

* And some special calculations for the period between 1930-32 and 1950-52.

TABLES

SECTION A

MARRIED WOMEN AGED UNDER 50 AT CENSUS

Married once only or more than once

Tables A. 1-6, 8, 9, 12-14 :	One-fifth Sample
Tables A. 7, 10, 11 :	Complete count divided by five
Tables A. 15 and 16 :	Complete count, not <i>adjusted</i> for under-statement of women married more than once

Note :

The mean family sizes, fertility rates and proportions infertile in Tables A.15 and 16 should be used in preference to those in Tables A.10 and 11.

divided by five

Notes:- 1. See section title page on p.1 and General Explanatory Notes on p. viii.
2. Owing to the method of adjustment used (see p. xxi) the mean family sizes, fertility rates and proportions infertile in this table are less reliable than those in Table A.15.

Table B.4. - Urban/Rural Aggregates by Socio-Economic Groups

One-fifth Sample

Notes:- 1. See section title page on p.57 and General Explanatory Notes on p.viii.
2. This table excludes 4,934 women whose husbands were not gainfully occupied and did not state an occupation from which they had retired. Its sections therefore add up to the totals for socio-economic groups entire in Table B.3, but to slightly less than the totals for urban/rural aggregates entire in Table B.1.

Table B.5. - Differences between Ages of Husband and Wife

One-fifth Sample

- Notes:- 1. See section title page on p.57 and General Explanatory Notes on p.viii.
2. The sections of this table at young marriage ages exclude 136 cases where the husband's implied age was impossibly young, owing to errors in replies to the census questions or in processing. These sections do not therefore add up exactly to the totals in Table A.12. Other cells where the numbers are much affected though some real cases can exist have been marked †.
3. Standardised ratios for groups having no women in age-duration cells which in Table A.12 contain more than 20 per cent of all women have been marked ‡.

† This ratio has only a limited meaning. In its computation, cells of the "All Socio-Economic Groups" section of Table C.6 containing nearly a fifth of all women had to be omitted, there being no corresponding figure in that table for Socio-Economic Group 1. There are, of course, relatively few farmers outside Industry Group A.

Table C.3. - Socio-Economic Groups - continued

Table C.4. - Urban/Rural Aggregates by Socio-Economic Group Completed Fertility: Four-fifths Sample

Notes:- 1. See section title page on p. 177 and General Explanatory Notes on p.viii.
2. The sections of this table relating to socio-economic groups exclude 4,063 women whose husbands were not gainfully occupied and did not state any occupation from which they had retired. These sections therefore add up to the totals for socio-economic groups entire in Table C.3, but to slightly less than the totals for urban/rural aggregates entire in this table.

Table C.5. - Husband's Terminal Education Age }
by Socio-Economic Group

Completed Fertility: Four-fifths Sample

Notes:- 1. See section title on p.177 and General Explanatory Notes on p.viii.
2. This table is confined to women whose husbands were gainfully occupied (including those out of work and excluding the retired) and who stated their terminal education age.

Socio-economic Group	Terminal Education Age of Husband	Size of Family	Age at Marriage

TABLES

SECTION D

WOMEN MARRIED AT AGES UNDER 45 IN THE YEARS 1920 TO 1954

Married Once Only

MEAN FAMILY SIZE

by Calendar Year of, Age at and Duration of Marriage

Based on data from
the Sample Family Census taken in 1946 by the Royal Commission on Population,
the Annual Vital Statistics collected under the Population (Statistics) Act, 1938,
and the Census of 1951

Table D.1. - All Marriage Ages under 45

The first of these is the fact that the
 system is not a simple one. It is a
 complex one, and it is not possible to
 describe it in a few words. It is a
 system of many parts, and it is not
 possible to describe it in a few words.

The second of these is the fact that the
 system is not a simple one. It is a
 complex one, and it is not possible to
 describe it in a few words. It is a
 system of many parts, and it is not
 possible to describe it in a few words.

The third of these is the fact that the
 system is not a simple one. It is a
 complex one, and it is not possible to
 describe it in a few words. It is a
 system of many parts, and it is not
 possible to describe it in a few words.

TABLES

SECTION E

WOMEN MARRIED AT AGES UNDER 45 IN THE YEARS 1920 TO 1954

Married Once Only

FERTILITY RATES

by Calendar Year of, Age at and Duration of Marriage

Based on data from
the Sample Family Census taken in 1946 by the Royal Commission on Population,
the Annual Vital Statistics collected under the Population (Statistics) Act, 1938,
and the Census of 1951.

Table E.1. - All Marriage Ages under 45

Calendar Year of Marriage	Marriage Duration (completed years)

CENSUS REPORTS OF GREAT BRITAIN 1801-1931

A brief account of the history and development of the Census from 1801 to 1931, and of the nature and extent of the information and analyses published in the long series of official Reports.

Price 3s. 6d. *net* *By Post* 4s.

Obtainable from

HER MAJESTY'S STATIONERY OFFICE

at the addresses shown on cover page iv, or through any bookseller

PUBLICATIONS OF THE GENERAL REGISTER OFFICE

Weekly Return

Infectious diseases in each local area: Births and deaths in England and Wales, in London, in individual counties (including associated county boroughs) and in the five largest county boroughs, distinguishing deaths from certain notifiable diseases: Meteorological report. 1s. 6d. (1s. 8d.)

Quarterly Return

Numbers of births (live and still), marriages and deaths (distinguishing infant and neonatal deaths), together with rates in each quarter and year: Quarterly and annual figures of deaths by cause and sex: Vital statistics of certain foreign countries and great towns: Summaries of corrected notifications of infectious diseases: Changes in boundaries of administrative areas: Numbers of insured persons absent from work owing to sickness or industrial injury: Meteorological report: Special annual tables of National population estimates (by sex and age and in the Standard Regions and Conurbations), of populations and births and deaths assigned to each County and to the Metropolitan Boroughs, the 160 Great Towns and the 160 Smaller Towns, and of population projections and life tables. 2s. (2s. 2d.)

Statistical Review

The annual presentation and review of the vital statistics of England and Wales.

1954	Part I, Tables, Medical	12s. 6d.	(13s. 4d.)	1956	Part I, Tables, Medical	15s.	(15s. 11d.)
	Part II, Tables, Civil	6s.	(6s. 7d.)		Part III, Commentary	16s. 6d.	(17s. 3d.)
	Part III, Commentary	8s.	(8s. 9d.)	1957	Part I, Tables, Medical	20s.	(20s. 11d.)
1955	Part I, Tables, Medical	12s. 6d.	(13s. 5d.)		Part II, Tables, Civil	In the press	
	Part II, Tables, Civil	7s. 6d.	(8s. 1d.)		Part III, Commentary	In preparation	
	Part III, Commentary	11s.	(11s. 9d.)				

Supplements:

1950-1951	Supplement on Hospital In-patients Statistics	7s. 6d.	(8s. 1d.)
1952	Supplement on Cancer	8s. 6d.	(9s.)
1953	Supplement on Cancer	7s. 6d.	(7s. 11d.)
1952-1953	Supplement on Mental Health	11s. 6d.	(12s. 3d.)

Annual Estimates of the Population of England and Wales and of Local Authority Areas

A series of annual publications issued to meet a general demand for up-to-date figures of local populations, containing estimates of the populations of each local government area in England and Wales.

Populations as at 30th June, 1958 1s. 3d. (1s. 5d.)

Decennial Supplement

A decennial review of the vital statistics of England and Wales

1951	Life Tables	3s.	(3s. 5d.)
	Occupational Mortality, Part I	7s. 6d.	(8s.)
	Occupational Mortality, Part II	147s.	(149s.)
	Area Mortality	70s.	(70s. 8d.)

Studies on Medical and Population Subjects

A series of occasional publications designed to provide in convenient form a more extensive treatment of important subjects than is practicable within the limits of the annual Statistical Review.

No. 4.—Hospital Morbidity Statistics—A preliminary study of in-patient discharges. 3s. 6d. (3s. 11d.)

No. 6.—External Migration—A study of the available statistics, 1815-1950. 8s. 6d. (9s. 4d.)

No. 7.—General Practitioners' Records—An analysis of the clinical records of eight practices during the period April, 1951, to March, 1952. 8s. 6d. (9s. 1d.)

No. 8.—Measurement of Morbidity—A report of the Statistics Sub-Committee of the Registrar General's Advisory Committee on Medical Nomenclature and Statistics. 1954. 1s. 6d. (1s. 8d.)

No. 9.—(in continuation of Study No. 7)—General Practitioners' Records—An analysis of the clinical records of some general practices during the period April, 1952, to March, 1954. 1956. 6s. 6d. (6s. 11d.)

No. 10.—Tuberculosis Statistics for England and Wales 1938-1955—An analysis of trends and geographical distribution. 4s. (4s. 5d.)

No. 11.—Internal Migration—A study of the frequency of movement of migrants. 1s. 3d. (1s. 5d.)
